RE: Rail Investigation Area Interim Measure Field Investigation Report – Updated September 2021

Submitted via Montana File Transfer Service with Hard Copy to follow

Dear Ms. Kirkpatrick,

Please find attached Calumet Montana Refining LLC's (CMR) Rail Investigation Area Interim Measure Field Investigation Report (RIAIM Report) which has been updated to reflect our updated understanding of the Conceptual Site Model (CSM). The RIAIM Report presenting the findings from this work was originally submitted to MDEQ in September 2019. Since that time, additional subsurface investigations were conducted on behalf of CMR within or adjacent to the CMR facility. The findings from these investigations resulted in Ramboll US Consulting, Inc. (Ramboll) preparing an update to the CSM which was submitted to MDEQ in June 2021 as an Appendix to the 2020/2021 Annual Groundwater Sampling Summary Report. This updated version of the RIAIM report incorporates the updated CSM that provides an improved understanding of the geology and hydrogeology associated with the site and aid in evaluation of current interim measure activities and scoping of the upcoming of the RCRA Facility Investigation (RFI) at the site. Portions of the attached report that have been modified since the original submittal are denoted by *italicized text*.

The report presents the findings of investigation activities in the East and West Rail Loading Rack Investigation Areas (RIAs) at the CMR property in Great Falls, Montana. The report was developed in response to MDEQ's correspondence dated November 8, 2017 that directed CMR to conduct additional investigative work to determine the extent

and magnitude of contamination in the RIAs. Site investigation activities were performed in accordance with the Rail Investigation Area Interim Measures Work Plan dated November 15, 2018, which was subsequently approved by MDEQ in an approval letter dated January 28, 2019, and Work Plan Addendum dated June 13, 2019, which was verbally approved by MDEQ on June 14, 2019.

Based on the findings of the RIAIM, no additional interim actions are recommended regarding impacted groundwater at this time. The following activities are anticipated to be included as part of the upcoming RFI:

- Characterization of the groundwater quality in the Upper Bedrock Semi-Confined Saturated Zone down-gradient of the East Rail;
- Characterization of the groundwater quality in the Perched Unconfined Saturated Zone down-gradient of the West Rail;
- Abandonment and replacement of one crossed connected monitoring well (MW-91) with one monitoring well cluster to be installed in the Perched and Upper Bedrock Saturated Zones (MW-91S/MW-91D); and
- Installation of one Upper Bedrock Saturated Zone monitoring well (MW-79D2).

If you have any questions or concerns related to the Report, please don't hesitate to call me directly at (406) 454-9887.

Regards,

Joe Dauner

Title: Vice-President, Calumet Montana Refining, LLC

Date:

EXECUTIVE SUMMARY

The Montana Department of Environmental Quality (MDEQ) directed Calumet Montana Refining, LLC (CMR) (the Site) to conduct additional investigative work to determine the extent and magnitude of contamination at/near the CMR property in Great Falls, Montana, identified at the East and West Rail Loading Rack Investigation Areas [rail investigation areas (RIAs)] in CMR's Resource Conservation and Recovery Act (RCRA) Facility Investigation (RFI). MDEQ specifically directed that CMR prepare an Interim Measures (IM) Work Plan for the East and West Rail Loading Racks in correspondence dated November 8, 2017.

CMR submitted a draft RIAIM Work Plan on December 15, 2017, to which MDEQ provided comments on May 15, 2018. Based on those comments, additional discussions, and correspondence, a revised RIAIM Work Plan was prepared and submitted in November 2018. MDEQ approved the revised RIAIM Work Plan in January 2019. Field implementation activities began the week of May 13, 2019, and due to unexpected subsurface conditions encountered in the East Rail Loading Rack Area, an addendum to the RIAIM Work Plan was submitted to MDEQ on June 13, 2019. MDEQ approval to implement the changes detailed in the RIAIM Work Plan Addendum was provided during a teleconference on June 4, 2019.

Pre-rail investigation drilling methods employed at the Site included a combination of direct push, hollow stem auger and air rotary. Previous investigators interpreted borehole refusal as the top of bedrock. Accordingly, the pre-rail investigation Conceptual Site Model (CSM) consisted of unconsolidated sands and/or clayey sands with intermittent silts from ground surface to approximately 5-15 feet below ground surface (bgs) underlain by a competent, red-colored shale bedrock at depths ranging from approximately 3-20 feet bgs with the upper surface of the bedrock somewhat weathered with fractures.

Sonic drilling methods were employed for the first time at the Site in April 2019 to drill and install monitoring wells along the perimeter of the refinery. Three monitoring well boreholes (MW-91, MW-97, and MW-98) drilled just south of the East Rail Loading Rack Area along the Missouri River achieved depths below the top of a dusky red well lithified silt unit.

Additional subsurface investigations have occurred to the east of the refinery at Area of Concern (AOC)-16 along North River Road, south of CMR's truck loading rack. To further understand the lithology that underlies the entire operation of the refinery, Ramboll US Consulting, Inc. (Ramboll), on behalf of CMR, prepared an Updated CSM following an investigation of geologic outcrops along the northern bank of the Missouri River conducted during September 2020. The findings from the geologic outcrop investigation were integrated with previous field investigations, including a review of site-specific geologic literature, boring logs and well construction information, and historic groundwater elevations, down-gradient of the AOC-16 Area along North River Road, West Rail Loading Area (West Rail), East Rail Loading Area (East Rail) and along the Missouri River. The complete updated CSM is presented in the Updated CSM (CMR 2021a) and is included as Appendix A.

The current understanding of the Site's hydrostratigraphy has been incorporated into pertinent sections of this report and are as follows:

- *The **Perched Unconfined Saturated Zone** is a low yield hydrostratigraphic unit present within fill, glaciolacustrine deposits and/or poorly lithified mudstone/siltstone that contain various amounts of fine sand. The top of competent bedrock is encountered and appears laterally continuous across the Site as a dusky-red siltstone. The weathered portion of the dusky-red siltstone is moist and constitutes the base of the Perched Unconfined Saturated Zone. Due to the heterogenous and often re-worked nature of colluvial deposits at the Site, perched groundwater was observed to be discontinuous. Groundwater elevations in the perched hydrostratigraphic unit shows a rapid response to infiltration of surface water from rain and/or snowmelt.*
- *The **Upper Aquitard** which hydraulically separates the overlying Perched Unconfined Saturated Zone and the underlying Upper Bedrock Semi-Confined Saturated Zone is comprised of the dry dusky-red siltstone. This unit is composed of a well lithified siltstone/mudstone interbedded with moderately to well cemented sandstone. The Upper Aquitard is continuous across the Site except for a few locations where it has been either removed by excavation or erosional processes. [1] The low permeable strata of the aquitard impedes the hydraulic communication between the overlying Perched Unconfined Saturated Zone and the underlying Upper Bedrock Semi-Confined Saturated Zone.*
- *The **Upper Bedrock Semi-Confined Saturated Zone** is a low yield hydrostratigraphic unit underlying the Upper Aquitard and is composed of alternating layers of hard massive siltstone and/or shales[2] with fine to very fine sandstone lenses and/or beds.*

The heterogeneous nature of the lithology, stratigraphic occurrence, lateral discontinuity of deposits in these zones, result in limited groundwater movement through the more permeable lenses/layers or bedding planes.

Historical sources of information were reviewed to better understand any contamination identified during this investigation that may be related to past activities in and near the RIA. These historical sources included: spill information dating back to 1981, historical aerial photographs, historical Sanborn Fire Insurance maps and historical topographic maps. Several significant spills were identified that could be a contributing factor to contamination in the RIAs and some potentially relevant activities that could have resulted in subsurface impacts were identified via the historical aerial photographs. In addition, historic releases from the 16 current or former solid waste management units (SWMUs) and AOCs in and

[1] The first stratigraphic unit associated with the fifth member (Kk5) of the Kootenai (i.e., dusky-red siltstone) was not observed at three monitoring wells (MW-11, MW-62, and EB-15/MW-99) likely due to excavation related to the construction of 15th Street Bridge and/or erosional processes. The absence of this unit could provide a more readily available migration pathway for perched unconfined groundwater to the Upper Bedrock Semi-Confined Saturated Zone.

[2] The top of the Upper Bedrock Semi-Confined Saturated Zone is typically observed as a gray siltstone and/or shale.

surrounding the East Rail Area and five current or former SWMUs and AOCs in the vicinity of the West Rail Area are likely contributing to the impacts observed in the RIAs

The extent of light non-aqueous phase liquids (LNAPL) in the RIAs was discovered to be far less than originally believed based on past investigations, particularly the results of the Laser-Induced Fluorescence (LIF)/Ultraviolet Optical Screening Tool (UVOST®) investigation in 2017. In the East Rail Area, LNAPL was present in one of the borings/monitoring wells (EB-03/MW-101) installed as part of this rail investigation and in MW-79S which was replaced as part of this effort. In the West Rail Area, a thin layer of LNAPL accumulated on groundwater in WB-01S and WB-02S which are located nearest to the LNAPL recovery wells MW-73, MW-75, and MW-76.

All significant soil impacts in the RIAs are limited to the perched lithologic zone (i.e., present in the upper 10 feet of heavily reworked material above the Upper Aquitard). In general, hydrocarbon contamination was not observed within the screened interval associated with the Upper Bedrock Semi-Confined hydrostratigraphic unit. Petroleum hydrocarbon groundwater impacts were identified in both the Perched Unconfined Saturated Zone and the Upper Bedrock Semi-Confined Saturated Zone, but to a far lesser degree in the latter. Petroleum hydrocarbon impacts in the East Rail Area are more prevalent in the eastern portion of the area than the western portion.

Groundwater within the Perched Unconfined Saturated Zone does not have an apparent connection to the adjacent Missouri River, nor does there appear to be substantive vertical migration of the groundwater through the dry dusky red Upper Aquitard unit (i.e., decrease in soil moisture content and increase in bedrock competency) to the underlying Upper Bedrock Semi-Confined hydrostratigraphic unit. Groundwater flow in the perched and upper bedrock hydrostratigraphic units is south towards the Missouri River, located directly down-gradient of the Site and may daylight along the riverbank. Based on stratigraphic correlation and elevation data, groundwater in the Upper Bedrock Semi-Confined Saturated Zone may also daylight along the riverbank above the river level and/or may discharge into the riverbank below the level of the river. Hydraulic conductivities measured in the down-gradient wells near the river are quite low and would minimize the volume of impacted groundwater reaching the shoreline.

Based on the results of this and previous investigative work in the RIAs, no additional IM response actions are recommended for groundwater in the East and West Rail Areas at this time and recommended actions are limited regarding LNAPL and soil. Recommended actions in the RIAs are summarized by area below:

EAST RAIL AREA

LNAPL/Source Area

Continue the recovery activities using sorbent socks that are currently installed in MW-97, MW-70, MW-14R and MW-48 in and downgradient of the East Rail. Consider LNAPL recovery activities using sorbent socks at MW-79S and MW-101 if LNAPL thicknesses increase.

Further evaluate the sewer line (SWMU 20) in the vicinity of MW-101S to determine if releases from this sewer line are the source of the LNAPL observed in this well. Impacted shallow soil and groundwater directly adjacent to refueling track pans do not appear to be associated with this well. If confirmed as the source, repair of the sewer line (SWMU 20) in the vicinity of MW-101S is recommended.

Soil

CMR has developed a soil management plan to guide any potential excavation and utility work in the East Rail Area for the purposes of limiting exposure to contaminants by construction workers and to appropriately manage the waste soil generated.

Determine appropriate facility-specific background concentrations in shallow soil as part of the upcoming RFI, with the collection of background samples from unimpacted areas that are representative of natural conditions. The background data collected will be used to evaluate if the elevated inorganic concentrations in the shallow soil horizon are at least in part naturally occurring background levels.

Elevated inorganics concentrations in the shallow soil horizon may in part be due to naturally elevated levels in site soil and/or historic rail operations. The historic rail operations included the transportation of coal and/or ore material through the present-day East and West Rail Areas to the former Anaconda Copper Mining (ACM) Company Smelter and Refinery approximately 1 mile east of CMR, which is currently on the National Priorities List (NPL).

Groundwater

No additional actions are recommended regarding impacted groundwater at this time. The following activities are anticipated to be included as part of the upcoming RFI:

- *Characterization of the groundwater quality in the Upper Bedrock Semi-Confined Saturated Zone down-gradient of the East Rail;*
- *Abandonment and replacement of one crossed connected monitoring well (MW-91) with one monitoring well cluster to be installed in the Perched and Upper Bedrock Saturated Zones (MW-91S/MW-91D); and*
- *Installation of one Upper Bedrock Semi-Confined Saturated Zone monitoring well (MW-79D2).*

WEST RAIL AREA

LNAPL/Source Area

Operation of the existing product recovery system should continue. The system was recently upgraded (October 2020) with the addition of skimmer pumps to replace the total fluid recovery pumps. Further evaluation of potential upgrades related to the system, both the wells and the interceptor trench, to include valving so that product recovery volumes from each well and the trench can be measured separately. Based on the recovery

information, the need for any additional upgrades to the system in this area may need to be assessed.

Soil

CMR has developed a soil management plan to guide any potential excavation and utility work in the West Rail Area for the purposes limiting exposure to contaminants by construction workers and to appropriately manage the waste soil generated.

Determine appropriate facility-specific background concentrations in shallow soil as part of the upcoming RFI, with the collection of background samples from unimpacted areas that are representative of natural conditions. As with the East Rail Area, the background data collected will be used to evaluate if the elevated inorganics concentrations in the shallow soil horizon are at least in part naturally occurring background levels.

Groundwater

No additional actions are recommended regarding impacted groundwater. However, as part of the upcoming RFI CMR it is anticipated that characterization of the groundwater quality in the Perched Unconfined Saturated Zone down-gradient of the West Rail will be included.

1. INTRODUCTION

In correspondence dated November 8, 2017, MDEQ directed CMR to conduct additional investigative work to determine the extent and magnitude of contamination at/near the CMR property in Great Falls, Montana, identified as the East and West Rail Loading RIAs in CMR's RFI. MDEQ specifically directed that CMR prepare an IM Work Plan for the East Rail and West Rail to accomplish the following objectives:

- Investigate soil for impacts to human health (including onsite industrial workers) and the environment;
- Conduct additional groundwater monitoring, including analysis for volatile organic compounds (VOCs), semi-VOCs (SVOCs) and inorganics;
- Further assess the mobility and recoverability of non-aqueous phase liquids (NAPL); and
- Evaluate technologies to address source control, groundwater contamination (both NAPL and dissolved phase) and soil contamination, especially soil above US Environmental Protection Agency (USEPA) Regional Screening Levels (RSL) for industrial workers.

CMR submitted a draft Rail Investigation Area Interim Measure (RIAIM) Work Plan December 15, 2017. In correspondence dated May 15, 2018, MDEQ provided comments to the draft RIAIM Work Plan. Based on those comments, additional discussions, and correspondence, a revised RIAIM Work Plan dated November 2018 was prepared that refined the objectives as follows:

- Assess the mobility and recoverability of LNAPL in the East Rail and West Rail; and
- Evaluate technologies to address source control, groundwater contamination (both LNAPL and dissolved phase) and soil contamination, especially soil above USEPA RSLs for industrial workers.

MDEQ issued an approval letter in response to the November 2018 RIAIM Work Plan. Following kickoff of field activities during the week of May 13, 2019, and initial field observations, an addendum to the RIAIM Work Plan was submitted to MDEQ on June 13, 2019, to address modifications related to the change in drilling equipment and subsurface conditions encountered in the East Rail. CMR informed MDEQ via telephone on June 4, 2019, that due to unexpected subsurface conditions encountered in the East Rail, a field decision was made to change the drilling methodology from direct push technology (DPT) to the use of a Sonic rig. Sonic drilling methods were previously used in April 2019 to drill and install 14 monitoring wells along the perimeter of the refinery as part of the implementation of the January 2019 Revised Site-Wide Groundwater Monitoring Work Plan. Three of the perimeter monitoring wells installed (MW-91, MW-97, and MW-98) are located along the Missouri River just south of the East Rail. At each of these monitoring well locations, a saturated sand unit with petroleum impacted groundwater was present at elevations ranging from approximately 3,310-3,320 feet above mean sea level (amsl) (12 to 25 feet bgs).

Implementation of the investigative activities defined in the RIAIM Work Plan began during the week of May 13, 2019, using a DPT rig in the East Rail. Six DPT soil borings were completed in the East Rail and all encountered refusal at depths ranging from 12-19 feet bgs and achieved a total basal elevation ranging from 3,322-3,325 feet amsl. Because the DPT drilling equipment could not reach the depth interval of the petroleum impacted groundwater zone along the Missouri River immediately to the south of the East Rail Area, a field decision was made to suspend the RIAIM investigation, demobilize the DPT rig and arrangements were made to complete the RIAIM investigation with Sonic drilling equipment.

This RIAIM Field Investigation Report presenting the findings from this work was originally submitted to MDEQ in September 2019. Since that time, additional subsurface investigations were conducted on behalf of CMR within or adjacent to the CMR facility (CMR, 2020a and CMR, 2020d). The findings from these investigations resulted in Ramboll preparing an update to the CSM (CMR, 2021) which had originally been developed from findings of the 2019 RIAIM. This updated version of the 2019 RIAIM report incorporates the updated CSM that provides an improved understanding of the geology and hydrogeology associated with the Site. The Updated CSM Report is included as Appendix A.

Those portions of the updated RIAIM report that have been modified/updated since the original submittal are identified by italicized text.

2. BACKGROUND INFORMATION

The CMR refinery is located at 1900 10th Street in Great Falls, Montana (Figure 1). The Site is bounded on the north by Smelter Avenue NE, on the south by the Missouri River, on the west by 6th Street NE and on the east by 11th Street NE. The refinery produces gasoline, middle distillates, and asphalt for nearby markets in Washington, Montana, Idaho and Alberta, Canada. The refinery has operated in the same location since approximately 1922 when it was owned and operated by the American Refining Company. The refinery ownership has changed hands during its tenure, but most recently was owned by Holly Oil Corporation (operated as Montana Refining Company) from 1984-2006, then by Connacher Oil and Gas Limited of Canada from 2006-2012 and currently by Calumet Specialty Products Partners, LP, who purchased the assets in 2012.

The approximately 87-acre site is improved with numerous structures and processing equipment throughout the property. The RIA encompasses both the West Rail and East Rail that are located south of the refinery process unit and tank farm areas (Figure 2).

2.1 RAIL AREA HISTORY

A RCRA Facility Assessment (RFA) was performed by Metcalf & Eddy (M&E) on behalf of USEPA in 1988 that identified several SWMUs and two AOCs throughout the refinery facility. The 1998 Final Description of Current Conditions Report (CCR) identified seven additional AOCs and the MDEQ Corrective Action Order on Consent (Order) identified an addition three SWMUs and four AOCs for a total of 32 RCRA units.

The locations of SWMUs and AOCs throughout the facility are depicted on Figure 3. The SWMUs and AOCs located within the vicinity or immediately up-gradient topographically of the East and West Rail Areas are as follows:

EAST RAIL AREA (AOC 24 – RAIL LOADING AREA)

- SWMU 1: Diversion Pond (unlined, operational from 1970-1985);
- SWMU 2: Overflow Sump (unlined, operational from 1970-1986);
- SWMU 3: Wastewater Surge Tank (located within SWMU 1);
- SWMU 4: API Separator (used since 1967);
- SWMU 5: Dissolved Air Floating (DAF) Unit (used since 1967);
- SWMU 6: DAF Cone Bottom Tank (located within SWMU 5);
- AOC 10: Tetraethyl Lead (TEL) Building (used until 1995);
- SWMU 11: Past Leaded Sludge Oxidation Area (used in the 1970s, located within SWMU 12);
- AOC 12: Staining Around Tanks 17, 52, 53, 54 (staining associated with nine recorded historical petroleum releases);
- AOC 13: Stained Area East of Former USEPA Well DH-1 (part of AOC 12);

- AOC 17: Asphalt and Heavy Oil Loading Rack (used since 1961);
- SWMU 20: Refinery Sewer System (in use, recorded historical releases);
- AOC 21: Emulsion Mill Area (part of AOC 24);
- AOC 22: Tank 50 Stained Area (inactive, historical asphalt spill);
- AOC 23: Tank 115 and 117 Stained Area and Sump (historical releases of fuel oil and sludge); and
- AOC 32: Tank 48 Spill Area.

WEST RAIL AREA (AOC 33 - Rail Line Expansion Area)

- SWMU 8: Aeration Pond (unlined, operational from 1970-1986);
- SWMU 9: Oxidation Pond (unlined, used from 1970-1986);
- AOC 26: Contaminated Area South of Landfarm (inactive, discolored soil observed 7-10 feet bgs);
- SWMU 27: Lead Pit (later identified during 2001 RFI activities); and
- SWMU 30: Tank 112 Dump Site.

Of the SWMUs and AOCs in the East and West Rail Areas, SWMU 8, SWMU 9 and SWMU 30 were granted no further action (NFA) status in the 2012 Order.

2.1.1 Historical Spills

In an effort to better understand any contamination identified during this investigation, Ramboll reviewed spill information provided by CMR dating back to 1981. Several significant spills were identified that could be a contributing factor to contamination in the rail areas. Only those spills of greater than 1,000 gallons of a material other than asphalt are discussed below:

EAST RAIL AREA

AOC 12 (Staining around tanks 17, 52, 53 and 54)

- 1995: One spill of 6,846 gallons of gasoline;
- 1997: Two spills of gasoline (1,500 gallons and 420 gallons);
- 1998: One spill of 12,600 gallons of gasoline;
- 2000: One spill of 5,250 gallons of gasoline;
- 2001: One spill of 5,712 gallons of gasoline;
- 2013: Spill recorded but no record of amount or material spilled; and
- 2014: One spill of 14,000 gallons of caustic.

SWMU 20 (Refinery Sewer System)

- 2000: One spill of 8,400 gallons of gas oil and water.

AOC 24 (Rail Loading Area)

- 2017: One spill of 1,620 gallons of an unidentified product.

WEST RAIL AREA

SWMU 9 (Oxidation Pond)

- 2001: One spill of 1,500 gallons of asphalt. Overflow went to Tank 50 dike, was contained. One spill of 1,100 gallons of diesel at tanks 127 and 128, drained to the Oxidation Pond.
- 2013: One spill of 1,400 gallons of gas oil. Gas oil is a type of fuel oil that is cheaper than normal road diesel due to it being a rebated fuel used for heating, vehicles, machinery in the construction and agricultural sector.

2.1.2 Other Historical Sources

Ramboll reviewed other historical sources of information that may provide insight into past activities in the rail areas that could have contributed to any impacts observed. Historical aerial photographs were obtained through CMR and a report ordered from Environmental Data Resources (EDR) provided additional historical aerial photographs, historical Sanborn Fire Insurance maps and historical topographic maps. Potentially relevant findings from our review are summarized by rail area in the following paragraphs.

2.1.2.1 Historical Aerial Photographs

The earliest aerial photographic coverage obtained is from approximately 1922. Coverage is more substantial for the East Rail Area than the West Rail Area. Appendix B provides the aerial photographs reviewed for this effort.

EAST RAIL AREA

An undated photo estimated to have been taken between 1922-1933 shows a creek or drainageway discharging to the Missouri River. It originates south of the railroad track but likely is piped subsurface beneath the tracks and portions of the refinery. The location appears to be between the current onsite wastewater treatment plant (WWTP) and the American Petroleum Institute (API) separator/DAF units.

By 1946 it appears that the drainage ditch was dammed as there is a pond at the location of the drainage ditch noted in the 1922-1933 photograph mentioned above.

In the 1953 photograph, the dammed pond referenced above appears to be overflowing to the river.

An undated CMR provided photograph (IMG869), which based on the EDR aerials appears to be from around 1960, shows two impoundments at the current location of the onsite WWTP and two small ponds east of the impoundments and west of the API separator/DAF units. The eastern most of these two impoundments corresponds to SWMU 1 (Diversion Pond). The small pond observed in area of EB-15/MW-99 is still present.

In 1964, the same two impoundments at the current location of the onsite WWTP and two small ponds east of the impoundments and west of the API separator/DAF units. The pond observed in the vicinity of EB-15/MW-99 is no longer present and there appears to be ground disturbance in this area.

By 1975, there are two small ponds located east of the two impoundments at the current location of the onsite WWTP that have been filled. A more pronounced drainage cut-out to the river was observed just south of the current Energy Substation (EDR photograph) located between the East and West Rail Areas.

In the 1984 aerial, there is some small tankage east of the two impoundments. There appears to be standing water south of these tanks perhaps related to a bermed area. This standing water is in the vicinity of SWMU 2 (Overflow Pond/Sump).

By 1990, though still present, it appears that the two impoundments are being decommissioned or refurbished as they appear smaller, and the boundaries are less defined.

A photograph dated February 1995 shows a depression in the vicinity of EB-15/MW-99. What appears to be an elevated rail line or piping run coming from the old rail bridge runs along the southside of the API area and ends at the onsite WWTP. The photograph also shows ponding within the tank berms north of the East Rail Area. A later aerial from 1995 shows that construction of the new bridge across the Missouri River has begun. Construction activities would include additional disturbance in the vicinity of EB-15/MW-99 and elimination of the elevated rail or pipe chase. The west impoundment is still present, but the east impoundment is now circular in nature and appears to be in the current configuration of the open-top SWMU 3 (Wastewater Surge Tank).

By 2006, the west impoundment is not present and in its place is the eastern most of the two current aboveground storage tanks (ASTs) at the onsite WWTP.

In 2013 it looks like a top has been added to SWMU 3 (Wastewater Surge Tank).

WEST RAIL AREA

The first historical aerial photograph that includes coverage of the West Rail Area is from 1975. It shows that SWMU 8 (Aeration Pond) and SWMU 9 (Oxidation Pond) are present north of the area and the city WWTP is present to the south.

Features in the West Rail Area appear to be relatively unchanged until 2006 when SWMU 9 (Oxidation Pond) appears to be dry. By 2009, both SWMU 8 (Aeration Pond) and SWMU 9 (Oxidation Pond) appear dry.

In 2013, both SWMU 8 (Aeration Pond) and SWMU 9 (Oxidation Pond) are being redeveloped for tankage and construction has begun for the aeration basins on the east side of the city WWTP.

2.1.2.2 Sanborn Fire Insurance Maps

Sanborn map coverage is very limited in the East Rail Area and non-existent for the West Rail Area. Coverage is focused on Main Plant and AOC 16 spanning the years from 1950-1965.

2.1.2.3 Historical Topographic Maps

Historical topographic maps provide no additional information related to the East Rail Area but do indicate that the city WWTP south of the West Rail Area was constructed sometime before 1965.

2.2 PREVIOUS INVESTIGATIONS AND REMEDIAL ACTIONS

The Montana Refining Company (MRC) performed site-wide RFI activities in 2004 that included the investigation of several SWMUs and AOCs within the rail areas. The soil results were compared to Residential and Industrial USEPA Region IX Preliminary Remediation Goals (PRGs) and Region III Risk-Based Concentrations (RBCs), used at that time to assist risk assessors and others in initial screening-level evaluations. Groundwater results were compared to PRG and RBC tap water standards and MDEQ Water Quality Circular WQB-7. Relevant findings from this investigation are summarized below:

- SWMUs 1-6 (East Rail Area): Benzene and benzo(a)pyrene above residential RBCs in soil at two locations and no measured concentrations exceeded groundwater standards;
- SWMUs 8 and 9 (West Rail Area): No analytes were measured at concentrations above the relevant standards. As a result, NFA status was received in 2012 without additional investigation;
- AOCs 10, 12, 13 and SWMU 11 (East Rail Area): Metals, polycyclic aromatic hydrocarbons (PAHs) and SVOCs, above soil and groundwater standards.
- AOC 17 (East Rail Area): Two SVOCs and one arsenic concentration exceeded industrial soil PRGs;
- SWMU 2 (East Rail Area): Lead exceeded residential and industrial soil PRGs, arsenic exceeded the residential soil PRG and benzene and 1,3,5-trimethylbenzene exceeded residential and industrial soil PRGs;
- AOC 21 (East Rail Area): No measured concentrations in soil exceeded residential PRGs;

- AOC 22 (East Rail Area): Impacted materials were excavated and disposed offsite in 2000;
- AOC 23 (East Rail Area): Lead, benzo(a)anthracene, benzo(b)fluoranthene and benzo(a)pyrene exceeded residential soil PRGs; benzo(a)pyrene also exceeded the industrial soil PRG;
- AOC 26 (West Rail Area): No measured concentrations in soil exceeded residential soil PRGs; and
- AOC 27 (West Rail Area): Metals, SVOCs and PAHs exceedances in groundwater from a down-gradient well.

MDEQ issued an Order in 2012 based on the results of historical RFI activities and several isolated soil sampling activities performed by MRC during the 2000s.

In June 2012, soil sampling activities identified concentrations of lead, benzene, ethylbenzene, and naphthalene exceeding USEPA industrial RSLs at AOC 32 (East Rail Area).

In July 2012, following excavation of hazardous soil from AOC 31 to address worker exposure concerns from lead; as required by the 2012 Order, AOCs 31-33 were regrouped into a Lead Consolidated Area (LCA) that also included AOCs 10, 12, 13, 22, 23, 25, 27 and SWMU 11. Many of these AOCs and SWMU 11 are potentially associated with observed impacts in the East Rail Area. The LCA was identified as having impacted site groundwater with metals, SVOCs and/or VOCs.

Interim soil removal RFI activities were performed in 2013 and 2014 by CMR to address the contamination associated with the LCA. Over 19,000 cubic yards (yd^3) of impacted soil in the LCA was excavated and disposed offsite. After the soil removal activities, CMR implemented a quarterly groundwater sampling program with samples to be analyzed for RCRA metals and Total Petroleum Hydrocarbons (TPH).

2.3 RECENTLY DOCUMENTED RELEASES

The most recent observed releases were discovered on June 6, 2017, near the West Rail Area and on June 20, 2017, south of the East Rail Area. Emergency response actions were implemented to address the releases due to an observed sheen on the Missouri River. These actions are detailed in the CMR Assessment Report for Rail Investigation and Remediation, August 2017 (Assessment Report, August 2017) and were summarized in the November 2018 RIAIM Work Plan.

Actions within the RIAs included performing a high-resolution site characterization event in an effort to delineate the extent and magnitude of LNAPL located at the West and East Rail Release Areas. The initial LIF/UVOST® investigation was performed starting on June 13, 2017, along the West RIA's north side. This investigation included analysis for fluorescent response at four locations from ground surface to a depth of approximately 9-12 feet bgs. As the UVOST® investigations were performed along the West Rail Release Area, the East

Rail Release Area release was discovered and investigation activities expanded to the East Rail Area.

LIF/UVOST® and DPT investigations continued between June 13 and June 22, 2017. Figures 4 and 5 present portions of the LIF/UVOST® response results for the East and West Rail Areas, respectively. In August 2017, an additional LIF/UVOST® investigation was performed to better delineate the area between the East and West RIAs and to extend the East RIA further east. The data from all three LIF/UVOST® events were composited for continuous spatial and depth analysis as of the August 30, 2017, Assessment Report for Rail Investigation and Remediation (CMR 2017a).

2.3.1 LNAPL Recovery Activities

Based on the results of the LIF/UVOST® investigations, CMR installed 10 additional groundwater monitoring/LNAPL recovery wells in December 2017 and February 2018 to support the ongoing investigation as well as to comply with MDEQ's directive for source control.

Four recovery wells were installed along the East Rail Area in February 2018 (MW-79, MW-80, MW-81, and MW-82) as depicted on Figure 6. Based on the well boring and construction logs each of the recovery wells were drilled to an approximate depth of 15 feet bgs and screened from total depth to 2-3 feet bgs. Little to no LNAPL accumulation was observed in these wells initially though in time a thin layer of LNAPL was reported in MW-79 located on the southside of the rail.

Six recovery wells were installed within the West Rail Area in December 2017 (MW-73, MW-74, MW-75, MW-76, MW-77, and MW-78) as depicted on Figure 7. Based on the well boring and construction logs, each of the recovery wells was drilled to an approximate depth of 10 feet bgs and screened from total depth to 2-3 feet bgs. MW-77 and MW-78 were installed north of the West Rail Loading Rack near the refinery sewer lift station. LNAPL was not found in these two wells before or after development but has been observed occasionally during site-wide groundwater monitoring activities at an approximate thickness of 0.01 feet measured in both wells.

Four of the wells (MW-73, MW-74, MW-75, and MW-76) were installed between the railroad tracks south of the southernmost loading rack. Three of these wells (MW-73, MW-75, and MW-76) exhibited measurable LNAPL thicknesses. During development of the wells several gallons of dark brown to black LNAPL was removed from MW-73 and MW-75 and what was described as red-dyed diesel was removed from MW-76. Following LNAPL transmissivity testing performed on these three wells to evaluate the recoverability of LNAPL in the West Rail Area, total fluids recovery pumps were installed in May/June 2018. *Installation of new skimmer pumps at three recovery wells (MW-73, MW-75, and MW-76) to replace the total fluid recovery pumps occurred in October 2020 has improved LNAPL recovery.*

As part of the initial response action taken in June 2017, a temporary trench system was installed down-gradient from the West Rail Loading Rack Seep Area just north of the city's

WWTP access road. The initial temporary trench installed in June was approximately 1 foot wide and approximately 130 feet long at a depth of approximately 2-4 feet bgs with a vertical sump in the center. Due to additional hydrocarbon seepage to the east a second trench was added to the east in September 2017. The combined length of both trenches is approximately 205 feet. Flow rates from the trenches in September 2017 were estimated at approximately 0.85 gallons per minute (gpm). A pneumatic pump in the trench conveys groundwater and LNAPL to CMR's WWTP (Assessment Report for Rail Investigation and Remediation, Addendum No. 2, dated October 13, 2017).

2.3.2 Historic LNAPL Fingerprinting

CMR collected one sample of LNAPL from MW-70 for carbon screening fingerprinting analysis to evaluate the distillation curves, sulfur content, petroleum hydrocarbon additive chemistry and petroleum hydrocarbon ranges present in the LNAPL. This sample was collected in July 2017 and submitted to Texas Oil Tech Laboratory for fingerprinting analysis. Texas Oil Tech Laboratory analyzed for hydrocarbon fingerprint and an expanded list of monocyclic aromatic hydrocarbons (MAHs) including benzene, toluene, ethylbenzene, and xylenes (BTEX), PAHs and saturated hydrocarbons.

Field observations noted that the LNAPL sample was dark in color. In general, the fingerprinting reported that "Sample MW-70 was a mixture of No. 2 fuel oil or diesel fuel and gasoline (or similar product)". The MW-70 sample also "contained TEL indicating that at least a portion of the gasoline was an historic variant". The presence of TEL in the MW-70 LNAPL sample and the more dominant weathered or heavier fuel oil components in the sample suggests both some evidence from a recent release and influence from historic variant or older LNAPL contamination. The LNAPL fingerprinting analytical report for monitoring well MW-70 is included in Appendix C of this report.

2.4 REGIONAL GEOLOGY AND HYDROGEOLOGY

The North American Cordilleran Orogeny led to the development of the Cordilleran Foreland Basin System and associated sedimentary deposits. These sedimentary deposits have been the focus of CMR geologic investigations. The archetypal collision of the North American Cordilleran fold and thrust belt lies to the west of present-day Great Falls and represents the collision of oceanic and continental lithosphere as the North American Continental Plate overrode the oceanic Kula-Farallon Plate during the Late Jurassic into the Early Cretaceous Period (beginning approximately 150 million years ago) (Reid 2015).

A non-marine, foreland basin system developed to the east of the topographic load of the North American Cordilleran Orogenic Belt, the associated foredeep of the foreland basin system infilled with fluvial and estuarine-dominated sediment deposits during the Early Cretaceous that thinned eastward, away from the collision boundary, meanwhile a forebulge emerged to the east of where the city of Great Falls is located today (Reid 2015).

The fluvial and estuarine deposits of the foreland basin system are dominated by silts and sands of the Kootenai Formation which represents the lithology that underlies the city of Great Falls and the CMR facility. The Kootenai Formation has informally been differentiated

into fifth member (Kk5 – shallowest and youngest), an upper and lower fourth member (Kk4 – older and underlying the Kk5), all of which is underlain by a member known as the Sunburst Sandstone (Reid 2015). These Cretaceous age lithologic units underlying the city of Great Falls are overlain by Pleistocene Deposits associated with the Pleistocene-aged, late-Wisconsin episode of the Laurentide Ice Sheet (Hill and Feathers, 2002).

2.4.1 Pleistocene Deposits

During the Pleistocene, the Keewatin Lobe of the Laurentide Ice Sheet blocked the Missouri River's northern course. (Alden 1932; Wilke 1983). This blockage forced the Missouri River to flow east around the glacier front. The Missouri River's new course eroded an entrenched paleochannel approximately 300 feet deep, along the city of Great Falls' western side, east along the city's southern side and north along the city's eastern side. The glacier dammed the Missouri River and its tributaries east of the city forming Glacial Lake Great Falls.

Tributaries deposited silt and sand near their mouths and clay, silt, and fine sand in the lake's quieter waters. These sediments have been dated at 16,900-14,800 years, indicating a late-Wisconsin episode (Hill and Feathers 2002). As the glacier receded northward, the glacial lake began draining east. Eventually, glacial drift blocked the Missouri River and the river course shifted north, cutting through the glacial and lake deposits south of the Site.

The Site is located on these glacial lake deposits, which overlie the consolidated Kootenai Formation. Lemke (1977) calls these sediments Deposits of Glacial Lake Great Falls. Lemke (1977) describes two subunits as an upper stratigraphic unit consisting predominantly of non-plastic fine sand and silt and a lower stratigraphic unit consisting mostly of laminated to non-laminated plastic clay and minor amounts of silt. The Pleistocene deposits are generally saturated but yield minimal quantities of water to wells because of their low hydraulic conductivity (Wilke 1983).

2.4.2 Kootenai Formation

Underlying the Pleistocene glacial lake deposits is the Cretaceous-age Kootenai formation that has been differentiated into the fifth (upper) and fourth (lower) members. The fifth member is distinguished by red-weathered mudstone that contains lenses and beds of brownish-gray and greenish-gray, cross-bedded, micaceous sandstone, and light gray nodular limestone concretions. The lower part contains a dark-gray shale and lignite bed with a significant pre-angiosperm flora. Thickness of the fifth member is estimated to be approximately 230 feet (Reid 2015). Maughan and Lemke (1991) describe the sandstone bodies in the upper member as averaging approximately 7 feet thick, soft and friable except for local calcareous cementation and consisting predominantly of quartz and chert with some clay grains. Wilke (1983) and Lemke (1977) indicated that perched groundwater is generally present in the upper member although the sandstone beds tend to be discontinuous and less productive aquifers. The bottom of the Kootenai formation's upper member is estimated to occur at 60-100 feet bgs near the Site.

The upper strata of the fourth member of the Kootenai Formation, which directly underlies the fifth member, has been identified as brownish-gray limestone and interbedded shale. The limestone contains ostracods and brackish water dinoflagellates (Burden 1984). The lower portion of the fourth member of the Kootenai Formation has been identified as sandstones interbedded with very dark reddish-brown mudstones that contain brackish water dinoflagellates (Burden 1984). The sandstones of the lower portion range from dusky-red to pale reddish-brown, fine to medium-grained, platy, thin to medium-bedded. Large channels cut through the lower portion of the fourth member unit and channel fill has been observed to be mudstone, interbedded sandstone and mudstone, or sandstone deposits (Hopkins 1985). Wilke (1983) describes several sandstone aquifers within the Kootenai Formation lower member in the city area. The approximate thickness of the fourth member of the Kootenai Formation has been estimated to be as much as 200 feet.

2.4.3 Site Geology and Hydrogeology

Previous investigation activities at the CMR facility have documented the presence of unconsolidated Pleistocene fluvial and lake deposits and various fill material at the ground surface immediately beneath the Site. These surficial units have been encountered at variable depths across the Site that range as much as 10-20 ft bgs. The fifth member of the Kootenai formation is encountered sitewide immediately beneath the surficial Pleistocene deposits and/or fill material. Based on the current understanding of the Site's geology, an updated CSM, included in Appendix A, identified two distinct hydrostratigraphic units that have been encountered at depth across the Site and overlie the shallowest potable aquifer present in the Great Falls area (Sunburst Sandstone Semi-Confined Aquifer) and regional limestone aquifer (Confined Madison Aquifer). The current understanding of the Site's hydrostratigraphy has been incorporated into the geologic and hydrogeologic understanding of the RIA's presented later in this report and is as follows:

- *The **Perched Unconfined Saturated Zone** is a low yield hydrostratigraphic unit present within fill, glaciolacustrine deposits and/or poorly lithified mudstone/siltstone that contain various amounts of fine sand. The top of competent bedrock is encountered and appears laterally continuous across the Site as a dusky-red siltstone. The weathered portion of the dusky-red siltstone is moist and constitutes the base of the Perched Unconfined Saturated Zone. Due to the heterogenous and often re-worked nature of colluvial deposits at the Site, perched groundwater was observed to be discontinuous. Groundwater elevations in the perched hydrostratigraphic unit shows a rapid response to infiltration of surface water from rain and/or snowmelt.*
- *The **Upper Aquitard** which hydraulically separates the overlying Perched Unconfined Saturated Zone and the underlying Upper Bedrock Semi-Confined Saturated Zone is comprised of the dry dusky-red siltstone. This unit is composed of a well lithified siltstone/mudstone interbedded with moderately to well cemented sandstone. The Upper Aquitard is continuous across the Site except for a few*

locations where it has been either removed by excavation or erosional processes. [3] *The low permeable strata of the aquitard impedes the hydraulic communication between the overlying Perched Unconfined Saturated Zone and the underlying Upper Bedrock Semi-Confined Saturated Zone.*

- *The **Upper Bedrock Semi-Confined Saturated Zone** is a low yield hydrostratigraphic unit underlying the Upper Aquitard and is composed of alternating layers of hard massive siltstone and/or shales*[4] *with fine to very fine sandstone lenses and/or beds.*

The geologic and hydrogeologic conditions in the RIAs obtained from May to June 2019 investigative work, as well as other investigative and remedial work conducted in this area, are presented in Section 4 of this report. The Sitewide CSM is provided as Appendix A.

[3] The first stratigraphic unit associated with the fifth member (Kk5) of the Kootenai (i.e., dusky-red siltstone) was not observed at three monitoring wells (MW-11, MW-62, and EB-15/MW-99) likely due to excavation related to the construction of 15th Street Bridge and/or erosional processes. The absence of this unit could provide a more readily available migration pathway for perched unconfined groundwater to the Upper Bedrock Semi-Confined Saturated Zone.

[4] The top of the Upper Bedrock Semi-Confined Saturated Zone is typically observed as a gray siltstone and/or shale.

3. FIELD ACTIVITIES

Field activities during the CMR RIAIM Field Investigation took place Thursday, May 16, 2019, through Wednesday, July 3, 2019. The field investigation was completed in response to MDEQ correspondence dated November 8, 2017, requesting additional investigative work to determine the extent of soil and groundwater contamination identified at the East and West Rail Loading Rack Investigation Areas. Field activities at the Site included soil boring advancement, monitoring well installation, soil sampling, groundwater sampling and hydrogeologic testing. All field activities were completed in accordance with the November 2018 RIAIM Work Plan and June 2019 RIAIM Work Plan Addendum. Weather conditions at the Site featured temperatures ranging from 55-85°F under partly cloudy to sunny skies.

3.1 SOIL BORING ADVANCEMENT

A total of 44 soil borings were installed during the field investigation: 21 in the East Rail Area [EB-01 (replacement wells MW-79S and MW-79D), EB-02, EB-03S (MW-101), EB-03D, EB-04S (MW-100), EB-04D, EB-05S, EB-05D, EB-06S, EB-06D (replacement wells MW-81S and MW-81D), EB-07S, EB-07D, EB-09S, EB-09D, EB-10, EB-11S, EB-11D, EB-14S, EB-14D and EB-15 (MW-99)], as depicted on Figure 6 and 23 in the West Rail Area (WB-01S, WB-01D, WB-02S, WB-02D, WB-03S, WB-03D, WB-04S, WB-04D, WB-05S, WB-05D, WB-06S, WB-06D, WB-07, WB-08, WB-09S, WB-09D, WB-11D, WB-12S, WB-12D, WB-13S, WB-13D, WB-14S and WB-15), as depicted on Figure 7.

Cascade Drilling was contracted to install soil borings in the East Rail and West Rail Areas and completed over the course of two distinct field events. The first field event was conducted from May 16-20, 2019, using a Geoprobe 3230DT DPT drill rig. The second field event was conducted from June 6-25, 2019, using a Boart Longyear BL100C Sonic drill. The switch from DPT to Sonic drilling was necessitated by difficulties encountered during DPT drilling, in which the DPT tooling was unable to advance past 19 feet bgs through a dry dusky red unit (i.e., siltstone and/or mudstone), which was encountered approximately 6-15 feet bgs. A Sonic rig was utilized during the second field effort to advance subsequent soil borings further into and beyond the dry dusky red unit and to isolate the shallow water bearing zone from any deeper water bearing zones for groundwater sampling and hydrogeologic testing[5].

It should be noted that there were a few minor deviations from the boring locations in the Work Plan originally submitted to MDEQ. Table 1 provides a summary of the revised drilling and sampling program. In the East Rail Area, EB-12, and EB-13, which were originally identified as soil borings to be converted to permanent monitoring wells, were removed from the field investigation due to site infrastructure (tank berm height) and the proximity of existing down-gradient permanent monitoring wells MW-91, MW-97 and MW-98. An additional down-gradient soil boring, EB-15, was added to the field investigation and installed outside the Site fence, in the grassy embankment approximately 75 feet east of

[5] The drilling scope was expanded to greater depth due to the elevated photoionization detector (PID) readings observed in the relatively dry dusky red silt at depth below the shallow water bearing intervals and the presence of water bearing strata below the red dusky silt/clay in MW-97 and MW-98 located to the south of the East Rail Rack Area near the Missouri River.

MW-11. No adjustments were made to the proposed soil boring locations in the West Rail Area.

All drilling tooling and equipment was decontaminated at the decontamination station setup near the Site wastewater treatment drain prior to and following the installation of each soil boring. Investigation derived waste (IDW), including soil cuttings and drilling water, was containerized in metal 55-gallon drums, which were labeled and staged onsite in a location designated by CMR staff for waste characterization sampling and appropriate disposal.

3.2 MONITORING WELL INSTALLATION

Five soil borings were converted to permanent monitoring wells: EB-01 to nested pair MW-79S and MW-79D, EB-06 to nested pair MW-81S and MW-81D, EB-04S to MW-100, EB-03S to MW-101 and EB-15 to MW-99. The nested pairs of MW-79S and MW-79D (EB-01) and MW-81S and MW-81D (EB-06) were installed to replace MW-79 and MW-81, which were abandoned June 5-6, 2019, along with MW-80 and MW-82 due to poor condition (well screen seal damaged/removed during installation of flush mount well vaults). Monitoring well couplets MW-79S/MW-79D and MW-81S/MW-81D were designed to differentiate between shallow and deep soil and groundwater impacts immediately down-gradient of the East Rail Rack Loading Area. MW-100 (EB-04S) and MW-101 (EB-03S) were designed to function as source area monitoring points. These soil borings were identified as monitoring well locations due to the presence of free phase product observed in the soil core in EB-04S and soil core and groundwater in EB-03S. MW-99 (EB-15) was installed outside the Site fence to serve as a side/down-gradient monitoring location. This monitoring well was placed down-gradient of the East Rail Area Loading Rack and side-gradient from MW-97, which is impacted with dissolved and free phase product.

Monitoring wells were installed with 2-inch diameter, schedule 40 Polyvinyl Chloride (PVC) riser connected to 2-inch diameter, Schedule 40 PVC screen with 0.01-inch mill slots. Filter pack sand and bentonite chip screen seal were installed in the annular space between the borehole and PVC casing as the drill tooling was slowly removed from the borehole.

3.3 SOIL SAMPLING

Soil samples were collected from the 44 boring locations advanced along the East and West Rail Areas during both drilling mobilizations. A total of 60 soil samples were collected throughout the investigation for laboratory analysis: 32 from the East Rail Area [eight surface (0-2 feet bgs) and 24 subsurface (>2 feet bgs)] and 28 samples from the West Rail Area (four surface and 24 subsurface). A total of 17 geotechnical samples were collected as part of the investigation: 6 from the East Rail Area and 11 from the West Rail Area.

The soil borings were advanced to depths ranging between approximately 5-40 feet bgs utilizing DPT with a Geoprobe drill rig with a 2-inch diameter drive rod and a Sonic drill rig with 6.25-7. 25-inch drill steel. Soil samples were continuously collected from each boring and divided for field screening, laboratory analysis and in-field classification (noting soil

types, moisture, grain size distribution, color and staining or odors, if any). The soil samples were field screened for the presence of VOCs, methane (CH_4), oxygen (O_2) and hydrogen sulfide (H_2S) using a calibrated RKI GX-6000 PID equipped with a 10.6 electron volt (eV) lamp. The PID was calibrated in the field according to manufacturer's instructions, using four gas standard and air (zero gas) and checked between each screening event for proper response. Soil descriptions and PID readings are presented on the soil boring logs, which are included as Appendix D.

All soil samples collected for laboratory analysis were placed in sterile, laboratory provided bottleware and placed in a cooler with ice. Soil samples submitted for laboratory analytical testing were shipped overnight to Shealy Environmental Services, Inc. Analytical Laboratory in Columbia, South Carolina, for analysis of VOCs by EPA Method SW8260B, SVOCs by EPA Method SW8270D, volatile petroleum hydrocarbons (VPH) by MDEQ VPH, extractable petroleum hydrocarbons (EPH) by MDEQ EPH and dissolved metals by EPA Method SW6020B. Relatively undisturbed soil Geotechnical samples were collected at the time of drilling with the DPT drill rig using the core barrel sampler and acetate liners and Shelby tube samplers were driven into the ground to extract soil samples using the Sonic drill rig. Due to depth limitations due to difficult drilling, two samples were collected in the liner bag used inside the 6.25-inch steel casing driven by the Sonic drill rig [CMR-EB07 (deep) 17-18 and CMR-EB11 22. 5-23.5]. The geotechnical samples were kept refrigerated until the time of shipment, when they were placed in a cooler with ice. Geotechnical samples were shipped via FedEx ground to Core Lab in Bakersfield, California, for grain size analysis, moisture content, dry bulk density, porosity, total organic carbon (TOC) and fractional organic carbon analysis. Laboratory reports for the geotechnical samples are included as Appendix E.

3.4 GROUNDWATER SAMPLING

Groundwater samples were collected from temporary monitoring wells and newly installed permanent monitoring wells in the East and West Rail Areas. A total of 35 groundwater samples were collected during the investigation: 16 from the East Rail Area and 17 from the West Rail Area. Temporary monitoring wells were installed at selected soil boring locations by placing 2-inch diameter, schedule 40 PVC riser and a 5-foot section of 2-inch diameter, Schedule 40 PVC screen with 0.01-inch mill slots in the open borehole. No filter pack or seal material was installed in the annular space between the PVC casing and the wall of the borehole. Prior to setting the deep temporary wells the outer drill casing had been set to approximately 10-20 feet bgs (the inner casing removed soil to the appropriate depth and was extracted leaving the outer casing in place to set the well and isolate the sample interval). A Geotech Geopump™ peristaltic pump was used to purge each temporary well approximately 30 minutes prior to sampling, or until turbidity decreased. A Horiba U-52 multiparameter water meter equipped with a flow cell was used to measure the following water quality parameters prior to sample collection: temperature, pH, oxidation-reduction potential (ORP), conductivity, turbidity, and dissolved oxygen (DO). Groundwater water quality parameters were not collected for temporary wells with observable groundwater impacts, such as sheen or hydrocarbon odor (EB-05 and EB-06) or small water column lengths (EB-04D and EB-14). An electronic oil/water interface meter

was used to gauge water levels during sampling. Groundwater grab samples were collected from temporary monitoring wells using a Geotech Geopump™ peristaltic pump.

Newly installed MW-79S and MW-79D (EB-01), MW-81S and MW-81D (EB-06), MW-99 (EB-15) and MW-100 (EB-04S) were sampled using low flow groundwater sampling procedures in accordance with the Sampling and Analysis Plan (SAP) and MDEQ Groundwater Sampling Guidance. Monitoring wells were developed prior to sampling with a submersible pump. Monitoring well development continued until at least three column volumes had been purged or until purged dry at least three times. Purged groundwater was offloaded into the facility wastewater treatment system following the completion of monitoring well development and groundwater sampling activities. A groundwater sample was not collected from monitoring well MW-101 (EB-03S) due to the presence of LNAPL.

All groundwater samples were placed in sterile, laboratory-provided bottleware and placed in a cooler with ice. Groundwater samples were shipped overnight to Shealy Environmental Services, Inc. Analytical Laboratory in Columbia, South Carolina, for analysis of VOCs by EPA Method SW8260B, SVOCs by EPA Method SW8270D, VPH by MDEQ VPH, EPH by MDEQ EPH and dissolved metals by EPA Method SW6020B. An inline 0.45 micron single-use nitrocellulose filter was used to field filter groundwater samples for dissolved metals analyses.

3.5 LNAPL SAMPLING

LNAPL samples were collected from temporary monitoring wells and newly installed permanent monitoring wells in the East and West Rail Areas using a peristaltic pump and clean disposable tubing, where the intake was placed near the top of the layer of LNAPL to reduce the amount of groundwater collected. The LNAPL/water mixture was placed in sterile, laboratory-provided bottleware allowing the LNAPL to separate from the water. LNAPL was pipetted into a 20-milliliter (mL) vials and shipped in accordance with the "excepted quantity" requirements. Ramboll collected LNAPL samples during this investigation and subsequently during groundwater sampling events in 2020, as follows:

- During this investigation, LNAPL samples were collected from temporary monitoring wells from two locations (WB-01S and WB-02S) in the West Rail Area and a newly installed permanent monitoring well in the East Rail Area (EB-03S/MW-101) on June 24, 2019, and July 3, 2019, respectively. LNAPL samples were shipped to SGS North America Inc. in Houston, Texas, for analysis of total sulfur content (ASTM D2622), relative density (ASTM D4052), boiling range distribution (ASTM D7169) and light hydrocarbons in stabilized crude oils (ASTM D7900).

- *LNAPL samples were also collected during the 1st Quarter 2020 (MW-97 and MW-101) and 3rd Quarter 2020 (MW-79D) groundwater sampling events (CMR, 2020b and CMR, 2020c). These samples were analyzed for saturated hydrocarbons by pyrolysis-gas chromatography using a flame ionization detector (GC/FID) by Core Laboratories in Bakersfield, California. An additional compositional analysis performed of the C5-C34 fraction for MW-79D provided further understanding of the type of LNAPL observed at each sample location compared to site specific refined*

products. [6] Details of the pyrochromatography analysis are discussed in Section 6.2.3.2 and located in the 3rd Quarter 2020 Groundwater Sampling Report (CMR, 2020c).

3.6 HYDROGEOLOGIC TESTING

3.6.1 Slug Testing

Slug tests were conducted in temporary well and permanent monitoring well locations to estimate hydraulic conductivity across the East and West Rail Areas. A total of 20 locations were slug tested: 14 in and down-gradient from the East Rail Area (EB-01/MW-79S, EB-01/MW-79D, EB-06/MW-81S, EB-06/MW-81D, EB-07S, EB-07D, EB-09D, EB-10, EB-11, EB-15/MW-99, MW-11, MW-91, MW-97, and MW-98) and six in the West Rail Area (WB-03S, WB-03D, WB-07, WB-09S, WB-11D and WB-13D). Slug test locations during the investigation were identified based on test feasibility (sufficient water column and length to complete test).

All temporary and permanent monitoring well locations were developed prior to slug testing. Temporary wells were developed and purged by removing approximately 1.5 gallons of water with a peristaltic pump (200 mL/minute for 30 minutes) prior to groundwater grab sample collection. Temporary wells converted to monitoring wells were developed and purged with a submersible pump prior to low flow groundwater sampling, in accordance with the RIAIM Work Plan.

Three slug initiation test methods were initially utilized: pneumatic, submersible pump and bailer. Slug test initiation methodology changed in response to the switch from DPT to Sonic drilling as a result of field conditions encountered during the initial field effort and operational issues with the pneumatic equipment. The pneumatic initiation method was attempted at temporary well locations EB-07-S and EB-11, which were completed with DPT during the initial field effort but due to equipment problems the results were questionable[7].

A submersible pump was used to initiate slug tests in EB-09D and EB-07D during the second field effort completed with Sonic drilling. The pump was placed at the bottom of the temporary well and used to remove approximately 4 gallons of water [3 liters (L)/minute for 5 minutes], causing an initial displacement of approximately 2 feet. Depth to water measurements were measured manually with an electronic oil/water interface meter.

The majority (16) of the slug tests were initiated by removing groundwater from the water column with a single 3 foot by 1.5-inch disposable polyethylene bailer during the second field effort completed with Sonic drilling. The calculated initial displacement based on the

[6] Site-specific crude oil fractionation/refined petroleum products at CMR are, as follows: C1-C5 (natural gas), C5-C11 (gasoline), C6-C11 (petroleum naphtha), C10-C14 (kerosene/paraffin), C11-C18 (diesel oil), C18-C25 (lubricating oil), C20-C27 (fuel oil), C25-C30 (grease/waxes) and greater than C30 (bitumen).

[7] The Geoprobe System® Pneumatic testing kit pressurizes the inside of the drill rod, forcing groundwater out of the screen. Subsequently releasing the pressure allows the groundwater back into the drill rod screen to facilitate a rising-head slug test. Water levels are monitored with water level transducers placed downhole prior to test initiation.

bailer dimensions is 0.28 gallons or 1.7 feet of water in a 2-inch diameter well casing. Approximately half of the bailer-initiated slug tests were within 75% of the calculated initial displacement, indicating optimal slug test initiation. The disparity between the calculated and observed initial displacement in the remaining half of the bailer-initiated slug tests is likely attributable to small water column length, partial filling of the bailer, or temporary well construction (absence of filter pack in the annular space between the 2-inch PVC well casing and the 7-inch borehole). Water level transducers (Solinst Levelogger® 3001) and a barometric pressure transducer (Solinst Barologger® 3001) were used to measure and correct water levels for barometric pressure fluctuations. Water level and barometric pressure data were collected in 5 second sampling intervals.

All slug tests were run to near completion (heads within 5% of initial static water level) to the extent practicable. All equipment, including electronic oil/water interface meters and transducers, was decontaminated prior to and following the completion of each slug test. A new disposable polyethylene bailer was used to conduct each bailer-initiated slug test.

Slug test water level response data were processed in AQTESOLV software (HydroSOLVE, Inc.) to estimate hydraulic conductivity (K). Data were processed and analyzed in accordance with the Field Guide for Slug Testing and Data Analysis (Midwest Geosciences Group) and the RIAIM Work Plan. The Bouwer and Rice and KGS curve fitting models (unconfined) were used to generate a best-fit line through the slug test water level response data and estimate a K-value for each test location.

3.6.2 LNAPL Baildown Testing

A LNAPL baildown test was completed to assess LNAPL transmissivity. The LNAPL baildown test was conducted in the East Rail Area at MW-101 (EB-03S) since this was the only location in the East Rail Area with sufficient LNAPL thickness (0.72 feet) to conduct a baildown test. No LNAPL baildown tests were completed in the West Rail Area due to insufficient LNAPL thickness in locations with measurable LNAPL (0.04 feet in both WB-01S and WB-02S). The LNAPL baildown test was completed in accordance with Ramboll standard operating procedures (SOPs) in the SAP. A Geotech Geopump™ peristaltic pump was used to initiate the LNAPL baildown test in MW-101 by removing all LNAPL to the extent practicable. An electronic oil/water interface meter was used to gauge water and LNAPL levels in the well during the recovery period of the test. Fluid levels were gauged in the well until the test was run to completion and the LNAPL thickness had recovered to within 90% of the original gauged thickness.

LNAPL baildown test data were processed and analyzed using the API LNAPL Transmissivity Workbook for Microsoft Excel™. The Bouwer and Rice (1976) and Cooper and Jacob (1946) methods were used to estimate LNAPL transmissivity.

4. GEOLOGY AND HYDROGEOLOGY

As discussed in Section 2.4.3, the Site's geology consists of unconsolidated Pleistocene fluvial and lake deposits and various fill material overlying the fifth member of the Kootenai Formation. Two distinct hydrostratigraphic units were encountered during this investigation. Specific and relevant findings for the Site's geology and hydrogeology are summarized in the sections below and provide support to the Site's Conceptual CSM provided in Appendix A. Cross sections were generated to depict the geology beneath the East Rail in Figures 8, 9A, 9B and 9C and the West Rail in Figures 10, 11A and 11B. A typical stratigraphic column schematic for the Site is presented in Figure 12. Borings logs are provided in Appendix D.

4.1 GEOLOGY

4.1.1 Surficial Deposits

In general, the surficial topography of the RIAs slope from east to the west and to the south towards the Missouri River. The West Rail investigation area and borings installed along the Missouri River are typically lower topographically than the those installed at the East Rail.

The surficial geologic conditions of the East Rail and West Rail Areas are heterogeneous and discontinuous in nature. Approximately the top 10 feet of material is composed of fill and/or reworked native material consisting of gravel with varying amounts of sand, silt, and clay with overall grain size fining with depth. Where present, staining was typically observed within the first 5 feet of material and strong hydrocarbon odor was typically noted within the upper 10 feet. Boring location EB-15 (converted to MW-99) was advanced offsite, adjacent to the river walk near the 10th Street NE bridge and is the one exception that demonstrated fill material to a depth of almost 20 feet bgs. The presence of fill was illustrated by an asphalt cobble identified at 19.5 feet bgs (approx. 3305 feet amsl). Based on fill typically extending to a maximum depth of approximately 10 feet bgs within the RIAs, the depth of fill material at this location is likely attributed to excavation activities associated with the construction of the 10th Street NE bridge and/or erosional processes along the Missouri River. Borings advanced within the drainage ditch immediately south of the West Rail or at the adjacent southern property boundary of the WWTP only noted fill materials within the first 1-5 feet bgs.

4.1.2 Weathered Bedrock

The shallow fill material at East Rail and West Rail is immediately underlain by a unit composed of primarily fine sand, silt, and clay, which is interpreted as the top of weathered and/or fractured bedrock. Direct push drilling was employed at the beginning of the rail investigation along the East Rail and capable of advancing through the surficial fill material into the underlying weathered and/or fractured bedrock to approximately 3,321-3,326 feet amsl before encountering refusal. The material at the depth of refusal (using direct push technology) was predominately composed of dusky-red siltstone or interbedded silt and clay (i.e., siltstone and/or mudstone) that featured horizontal fracturing. Based on the lithologic observations and the capability of DPT to advance into this unit, the approximate depth of refusal has been interpreted as the top of competent bedrock.

At the East Rail, the top of weathered bedrock was a thin gray siltstone overlying a thicker sequence of a dusky-red siltstone, whereas the dusky-red siltstone was the first lithologic unit encountered at the West Rail beneath overlying fill material. The dusky red unit featured weak to strong laminations. The dusky-red unit was not observed at EB-15/MW-99, as shown on the cross-sections depicted on Figure 9A. The absence of this unit is likely related to either mechanical removal during bridge construction and/or erosional processes.

4.1.3 Competent Bedrock

Deeper borings were advanced into the top of competent bedrock using sonic drilling methods, which provided meaningful insights into the differing bedrock stratigraphic units and the vertical extent of hydrocarbon contamination. The top of competent bedrock was based upon the refusal depth of DPT borings (at the East Rail), increased stiffness/density and a precipitous decline in hydrocarbon impacts (i.e., PID readings).

The top of competent bedrock was identified as either a dusky-red siltstone or an interbedded dusky-red and gray siltstone beneath the RIAs with two notable exceptions at the East Rail: EB-10 and MW-79S/D (Figure 9C). The top of competent bedrock at these two locations is interpreted as an underlying gray siltstone at approximately 3,320 feet amsl. On average, the thickness of weathered and/or fractured bedrock was slightly greater at the East Rail compared to the West Rail as demonstrated in Table 2, below.

Area	***Ground Surface Elevation (feet amsl)***	***Depth of Top of Weathered Bedrock (feet amsl)***	***Depth of Top of Competent Bedrock (feet amsl)***
East Rail	*3,327 to 3,345*	*3,328 to 3,336*	*3,318 to 3,323*
West Rail	*3,321 to 3,333*	*3,319 to 3,323*	*3,311 to 3,316*

***Table 2**: Depth of top of weathered and competent bedrock of soil borings and monitoring wells associated with the East Rail and West Rail Areas.*

Hydrocarbon impacts[8] were observed in soil borings and/or monitoring wells in the East Rail (EB-03, EB-04, EB-05, EB-07, EB-09D, EB-10, MW-79S/D and MW-81S/D) and West Rail (WB-01, WB-02, WB-04, WB-08, WB-09, WB-10 and WB-11). Hydrocarbon contamination was observed in the shallow horizon, weathered bedrock, and the top portion of the competent bedrock. Hydrocarbon odors and elevated PID readings were observed no greater than 6 feet into competent bedrock. In general, hydrocarbon impacts within the competent bedrock were observed to be more prevalent in the East Rail

[8] Hydrocarbon impacts refer to staining/sheen (where present), hydrocarbon odors and elevated PID measurements.

compared to the West Rail.[9] *This may be related to a number of factors that include greater degree of bedrock weathering and/or fracturing, vertical migration pathways resulting from construction-related activities and nature and extent of historical releases (see Section 2.1.1)*

In the deepest borings installed at the East Rail (EB-15/MW-99) and West Rail (WB-04D, WB-09D, WB-11D and WB-14D), a well cemented sandstone was encountered. The only boring to be advanced past the sandstone unit was boring WB-14D, located on the adjacent WWTP to the south of West Rail. The unit encountered beneath the sandstone at WB-14D was a dusky red siltstone underlain by a gray siltstone that extended to the terminal depth of the boring as shown on the cross section depicted on Figure 11A. It should be noted that indications of hydrocarbon contamination were not present within or below the well cemented sandstone, with the exception of EB-15D/MW-99, likely due to the removal of the overlying bedrock (i.e., dusky-red unit).

4.2 *HYDROGEOLOGY*

Soil borings were converted into temporary monitoring wells or permanent monitoring wells and installed in the Perched Unconfined and/or Upper Bedrock Semi-Confined hydrostratigraphic units, as discussed in Section(s) 3. 2 and 3. 4 and shown in Table 3 (see below). Field observations, groundwater parameters and slug test results are discussed in the sections below.

Area	***Temporary Wells or Monitoring Wells Installed in the Rail Investigation Areas***
East Rail (16 total)	*EB-01 (MW-79S/MW-79D), EB-02, EB-03S (MW-101), EB-03D, EB-04S (MW-100), EB-04D, EB-05S, EB-06 (MW-81S/MW-81D), EB-07S, EB-07D, EB-09S, EB-09D, EB-10, EB-11S, EB-14S, EB-15 (MW-99), MW-11, MW-97, and MW-98*
West Rail (16 total)	*WB-01S, WB-02S, WB-03S, WB-03D, WB-04S, WB-05S, WB-06S, WB-07, WB-08, WB-09S, WB-10S, WB-11S, WB-12S, WB-13S, WB-14S, and WB-15*

Table 3*: List of temporary wells or monitoring wells associated with the East Rail and West Rail Areas. Three existing monitoring wells (MW-11, MW-97, and MW-98) were included in the list of wells for the East Rail, as slug tests were performed at each location (see Section 4.2.1.2).*

4.2.1 Perched Unconfined Saturated Zone

As discussed in Section 2.4.1, the Perched Unconfined Saturated Zone is a low yield hydrostratigraphic unit present within fill, glaciolacustrine deposits and/or poorly lithified

[9] Elevated PID readings and olfactory evidence were observed to 3,302 ft amsl at monitoring well location EB-15/MW-99 located adjacent to the 10th Street NE bridge. The dusky red unit was notably not observed.

siltstone/mudstone (i.e., weathered and/or fractured bedrock) that contain various amounts of fine sand.

Perched groundwater is primarily associated with moist to wet fill and/or re-worked material observed between 2-10 feet bgs at both RIAs. Moisture content significantly decreased in the upper portions of the weathered bedrock as it transitions to more competent bedrock, which appears to be the primary impediment for vertical migration of surface and groundwater infiltration. Another factor influencing the perched groundwater at the East Rail was a geofabric liner observed at 3 feet bgs in hand-augured boring EB-02 located between the rail tracks. It is not known how far the geotextile liner extends laterally; however, groundwater was perched on this manmade surface and observed to be daylighting to the south of the railroad ballast onto the vehicle road. In general, the upper portions of the weathered bedrock were primarily dry to slightly moist with occasional wet seams. Groundwater within the perched zone was observed to be discontinuous[10] and associated with more permeable lenses (i.e., increased grain size and/or poorly lithified), particularly within the upper portions of the weathered bedrock. Table 4 provides depth to water and groundwater elevations, the groundwater potentiometric surface map for the Perched Unconfined hydrostratigraphic unit is illustrated on Figure 13. It should be emphasized that the groundwater potentiometric surface map does not represent a continuous, homogeneous groundwater zone.

4.2.1.1 Groundwater Quality Parameters

Field measurements for ORP and DO indicate that anaerobic or reducing conditions exist in the shallow water-bearing zones. Anerobic conditions were identified in MW-79S (EB-01), MW-81S (EB-06), MW-100 (EB-04S), WB-02S, WB-09S and WB-12S. The presence of anaerobic conditions in the shallow groundwater is not unexpected given the staining, hydrocarbon odor and elevated PID readings observed during the installation of MW-79S/D, MW-81S and MW-100 and the presence of LNAPL in MW-101 (EB-03S). Boring WB-02S is located near MW-75 from which LNAPL is currently being recovered. WB-09S and WB-12S were advanced north of the interceptor trench which is located just outside the facility security fence at the down-gradient property line. The trench was installed in 2017 to serve as a control mechanism to prevent the migration of dissolved and separate phase hydrocarbon onto the adjacent property. The interceptor trench is 2-4 feet deep at the base, 350 feet long and is reportedly sitting on a low-permeability unit. Down-gradient, shallow monitoring well MW-66 exhibited anaerobic conditions in both May and August of 2019 during quarterly site-wide groundwater monitoring.

[10] Three shallow borings (EB-09S, WB-14S, and WB-15S), advanced within the perched zone, did not produce sufficient groundwater for measurement or sampling for laboratory analytical purposes. The material observed at EB-09S was dry to the terminal depth of the boring. Borings WB-14S and WB-15S were installed on the adjacent wastewater treatment property to the south of the West Rail, fill material at these locations was only encountered to a maximum depth of approximately 5 feet bgs.

4.2.1.2 Hydraulic Conductivity Testing

Summary slug test data, including K-value estimates, are presented in Table 5. Slug test model best fit curves are presented in Appendix F.

EAST RAIL

Eight slug tests were conducted in wells screened in the Perched Unconfined hydrostratigraphic unit in the East Rail Area, as follows: EB-01/MW-79S, EB-01/MW-79D, EB-06/MW-81S, EB-07S, EB-11S, MW-11, MW-97, EB-15/MW-99. The initial slug-testing method employed a pneumatic slug testing apparatus at EB-07S and EB-11S that did not function properly at either location. As such, the hydraulic conductivity values calculated for EB-07S and EB-11S were typical for unconsolidated gravel or clean sand, respectively (Freeze and Cherry, 1979) and were not consistent with the fine grain material that the wells were screened in. Therefore, the calculated values for these two tests were not considered representative values and were excluded in the assessment of hydraulic conductivity for the Perched Unconfined hydrostratigraphic unit. The median hydraulic conductivity for slug tests in the perched zone was 0.14 feet per day [$4.9x10^{-5}$ centimeters per second (cm/sec)][11]. This value falls within the low end of the range of hydraulic conductivity for a silty sand of $1x10^{-1}$ to $1x10^{-5}$ cm/sec (Freeze and Cherry, 1979) and is consistent with the lithology observed in the screened interval of wells completed in the Perched Unconfined Saturated Zone.

Of note, the hydraulic conductivity measured at MW-99 (EB-15) supported the observed absence of the dusky-red unit (which, is typically fine grained, competent, and representative of low transmissivity). The reported hydraulic conductivity at this location was 2. $3x10^{-4}$ cm/sec, representative of a clean sand.

WEST RAIL

Three slug tests were conducted in wells screened in the Perched Unconfined hydrostratigraphic unit at the West Rail Area, as follows: WB-03S, WB-07 and WB-09S. However, there was insufficient initial displacement in WB-03S to obtain an estimate of hydraulic conductivity therefore, this value was excluded in the assessment of hydraulic conductivity. The median (and average) hydraulic conductivity for slug tests successfully conducted in the two wells screened in the perched zone (WB-07 and WB-09S) was 3.0 feet per day ($1.1x10^{-3}$ cm/sec). This value of hydraulic conductivity falls within the lower end of the range of values expected for a sand ($1x10^{-3}$ cm/sec) (Freeze and Cherry 1979). The hydraulic conductivity for these wells is consistent with the sand observed in the screened intervals of WB-07 and WB-09S.

4.2.3 Upper Bedrock Semi-Confined Saturated Zone

As discussed in Section 2.4.1, the Upper Bedrock Semi-Confined Saturated Zone is a low yield hydrostratigraphic unit underlying the Upper Aquitard and is composed of alternating

[11] The Bouwer-Rice model is useful for determining the hydraulic conductivity of an unconfined aquifer such as the Perched Unconfined Saturated Zone present at the Site.

layers of hard massive to laminated siltstone and/or shales with fine to very fine sandstone lenses and/or beds. The heterogenous nature of the lithology results in discontinuous layers of permeability and limits groundwater movement through more permeable lenses/layers or bedding planes. This aquifer appears to be under semi-confining conditions, as indicated by water levels rebounding to a shallower level than originally observed.

A total of four borings and temporary wells along the East Rail (EB-05D, EB-06D, EB-07D and EB-14D) and a total of six borings and temporary wells along the West Rail (WB-02D, WB-03D, WB-04D, WB-06D, WB-09D and WB-13D) were interpreted to be installed within the Upper Bedrock Semi-Confined hydrostratigraphic unit. Table 4 provides depth to water and groundwater elevation information for the Site. A groundwater potentiometric surface map was not generated for the Upper Bedrock Semi-Confined hydrostratigraphic unit due to the insufficient number of monitoring wells installed in this unit to provide an accurate portrayal of groundwater surface conditions. In addition, limited groundwater was detected at temporary wells in the East Rail[12] and West Rail[13] that prevented the collection of field parameters and/or low-flow groundwater samples.

4.2.3.1 Hydraulic Conductivity Testing

Summary slug test data, including K-value estimates, are presented in Table 5. Slug test model best fit curves are presented in Appendix F.

EAST RAIL

Slug tests were conducted in wells screened in the upper bedrock zone (MW-06D/MW-81 and EB-07D) in the East Rail Area, the median hydraulic conductivity was reported to be 0.02 feet per day ($8.2x10^{-6}$ cm/sec)[14]. This value falls within the lower end of the range of hydraulic conductivity expected for silt or fractured shale (Freeze and Cherry, 1979).

WEST RAIL

Two slug tests were conducted in wells screened in the upper bedrock zone of the West Rail Area: WB-03D and WB-13D. The median hydraulic conductivity for slug tests conducted in wells screened in the upper bedrock zone was 0.10 feet per day ($3.4x10^{-5}$ cm/sec). This hydraulic conductivity falls within the low range of hydraulic conductivity for a silty sand ($1x10^{-1}$ to $1x10^{-5}$ cm/sec) and near the middle range of hydraulic conductivity for a sandstone ($1x10^{-4}$ to $1x10^{-8}$ cm/sec) (Freeze and Cherry 1979). This hydraulic conductivity is in good agreement with the moderately cemented sandstone and laminated

[12] Deep borings installed in the East Rail yielded very low volumes of water at EB-05D, EB-07D and EB-14D. Only a grab groundwater sample was collected for laboratory analysis at EB-07D and EB-14D, while EB-05D did not produce sufficient groundwater for field parameter measurements or to collect a sample for laboratory analysis (boring advanced to a total depth of 34 feet bgs, groundwater measured at 33.5 feet bgs).

[13] In the West Rail, no groundwater was measured in six of the ten deep borings that were screened within the Upper Bedrock Semi-Confined hydrostratigraphic unit (WB-02D, WB-04D, WB-06D, WB-09D, WB-14D) or cross-connected between the Perched Unconfined/Upper Bedrock Semi-Confined hydrostratigraphic units (WB-05D).

[14] The KGS model is useful for determining the hydraulic conductivity of unconfined and nonleaky confined aquifers.

siltstone/mudstone observed at the screen intervals for wells WB-03D and WB-13D, respectively.

4.2.4 Cross-Connected Wells

Seven wells along the East Rail and West Rail were interpreted to be cross connected wells between the overlying Perched Unconfined and the Upper Bedrock Semi-Confined hydrostratigraphic units, as follows: EB-09D, EB-10, EB-11D, WB-01D, WB-05D, WB-11D and WB-14D (including two permanent monitoring wells MW-91 and MW-98).

Temporary wells installed at EB-09D, EB-10 and WB-11D were placed within an open borehole. Potential influence from upper, perched saturated zones may have influenced the groundwater sample integrity at these locations. Cross connected wells were dry at EB-11D, WB-01D, and WB-05D.

Monitoring well locations MW-91 and MW-98 are located along the southern boundary of the Site near the Missouri River and were installed at relatively lower topography than locations advanced along the East Rail and West Rail. The dusky red unit is noticeably less thick at these borings than locations advanced further north within the refinery. The lower topography is likely due to increased weathering based on the proximity to the Missouri riverfront. The wells are screened across the overlying fill and/or weathered surficial material into the underlying dusky red and moderately- to well cemented sandstone units, at both locations. Elevated PID readings were observed at both locations to the terminal depth of the borings.

4.2.4.1 Hydraulic Conductivity Testing

The cross-connected wells demonstrated a decent amount of variability of hydraulic conductivity although, all reported values were within the ranges observed from wells screened in the overlying perched and underlying upper bedrock zones. Cross-connected wells reported hydraulic conductivities between $2.7x10^{-5}$ to $8.6x10^{-7}$ cm/sec, these values are comparable to silt or fractured shale, respectively (Freeze and Cherry, 1979).

5. SOIL ANALTYICAL RESULTS

5. 1 REGULATORY CRITERIA

The Tier 1 MDEQ Risk-Based Corrective Action (RBCA) approach is the simplest level of RBCA for petroleum releases in Montana and was applied to the East Rail and West Rail soil analytical data obtained as part of this investigation (MDEQ 2018). For the chemicals of potential concern (COPC), the flowchart evaluation process established by MDEQ was followed (MDEQ 2021)[15]; this approach is described in full in the flowchart included as Appendix G but is briefly summarized below. Soil samples were analyzed for organic compounds, specifically, for VOCs, SVOCs, MDEQ EPH and MDEQ VPH analytical methods. Analysis for inorganic compounds were completed for the USEPA Modified Skinner List of Compounds.

Any chemical with a maximum detected concentration above the MDEQ RBCA Risk-Based Screening Levels (RBSLs) (Commercial/Industrial and Construction) was determined to be a COPC. Based on the MDEQ Guidance Document regarding RBCA for petroleum releases (MDEQ 2018), direct contact MDEQ RBSLs are to be compared to both surface and subsurface soil analytical samples[16]. This guidance is based on the construction scenario that takes into account exposures potentially experienced by construction workers conducting excavation activities.

The MDEQ leaching to groundwater pathway RBSLs are determined based on the distance to groundwater from ground surface and beneath contaminated soil relative to the depth that a soil sample is collected. Due to the discontinuous nature of groundwater in the RIAs presenting as perched zones or permeable lenses, groundwater was observed within less than 10 feet below contamination for all soil samples collected as part of this investigation. Therefore, MDEQ leaching to groundwater pathway RBSLs for soils less than 10 feet to groundwater were utilized for regulatory comparison. Any chemical with a maximum detected concentration above the MDEQ RBCA RBSLs (Migration to Groundwater - <10 feet) was determined to be a COPC.

For both the direct contact and migration to groundwater scenarios, any inorganic compounds (USEPA Modified Skinner List) with a maximum detected concentration below MDEQ background values were not considered COPCs. Those compounds that did exceed background values were evaluated as potential COPCs.

The laboratory analytical results for East Rail and West Rail Area soil samples are presented on Table 6 and Table 7, respectively. In the soil analytical tables, COPC concentrations that exceed the direct contact RBSLs are boldfaced and COPC concentrations that meet or exceed migration (leaching) to groundwater RBSLs are underlined. The laboratory analytical reports, including the geotechnical analyses, are included as Appendix E.

[15] MDEQ surface and subsurface soil screening flowchart was revised in July 2021.

[16] Surface soils are defined as soils less than 2 feet bgs; subsurface soils are defined as soils deeper than 2 feet bgs.

Additional details that define regulatory comparison criteria for this investigation are outlined below:

Direct Contact Screening Levels

- *Detected chemicals without MDEQ RBCA RBSLs were compared to the commercial/industrial USEPA RSLs and any chemical with a maximum concentration greater than the applicable RSL was flagged as a COPC (carcinogens were compared to the cancer RSLs at a target cancer risk of $1x10^{-6}$ and non-carcinogens were compared to the noncancer RSLs at a target hazard quotient of 0.1).*

Migration to Groundwater Screening Levels

- *Detected chemicals without MDEQ RBCA RBSLs were compared to a modified migration to groundwater screening level calculated based on a dilution-attenuation factor of 10. The preferred groundwater target concentration for comparison is the MDEQ-7 human health standards (HHSs) and the USEPA Tapwater RSLs are used where no MDEQ-7 HHSs are available; any chemical with a maximum detected concentration above the modified screening level was determined to be a COPC.*

5.2 EAST RAIL AREA

5.2.1 Surface Soils (0-2 feet)

There were no organic compound direct contact COPC exceedances in surface soils. There were two direct contact COPC exceedances for inorganic compounds in soils (arsenic and cobalt).

The MDEQ background value for arsenic is 22.5 milligrams per kilograms (mg/kg) and the commercial/industrial USEPA RSL for arsenic is 3 mg/kg. Arsenic concentrations at EB-01, EB-07S and EB-10 exceeded the MDEQ background value for arsenic, with a maximum arsenic concentration of 490 mg/kg at EB-10 (0.5-1 foot).

The MDEQ background value for cobalt is 10 mg/kg and the commercial/industrial USEPA RSL for cobalt is 35 mg/kg. The cobalt concentration at EB-10 (0.5-1 foot) (37 mg/kg) exceeded the MDEQ background value and the commercial/industrial USEPA RSL.

Migration (Leaching) to Groundwater of Surface Soils (0-2 feet)

For organic compounds by MDEQ VPH, benzene was detected at the MDEQ Tier 1 Surface Soil screening level of 0.07 mg/kg for migration to groundwater at EB-01 (0.5-1 foot) (detected at an estimated concentration of 0.07 J mg/kg, between the method detection limit and limit of quantitation; "J-flagged"). This level was exceeded at EB-10 (0.5-1 foot) (0.3 J mg/kg).

Inorganic COPCs for migration to groundwater based on the respective MDEQ threshold value and USEPA RSL for migration to groundwater screening exceedances include:

- *Seven (7) Inorganic Compounds:*

- *Antimony: EB-10 (0.5-1 foot);*
- *Arsenic: EB-01 (0.5-1 foot), EB-07S (0-1 foot) and EB-10 (0.5-1 foot);*
- *Barium: EB-02 (0.5-1 foot);*
- *Cadmium: EB-10 (0.5-1 foot);*
- *Cobalt: EB-10 (0.5-1 foot);*
- *Copper: EB-01 (0.5-1 foot), EB-10 (0.5-1 foot); and*
- *Silver: EB-10 (0.5-1 foot).*

5.2.1 Subsurface Soils (>2 feet)

Analytical results for organic compounds exceeded regulatory criteria for direct contact in the saturated perched zone for at least one compound at all sample locations in the East Rail Area except for EB-07S (5.25-5.75 feet), EB-11S (2-2.5 feet), EB-14S (2-2.4 feet) and EB-15 (18-19 feet and 20-21.5 feet). The organic compounds that exceeded direct contact criteria and the respective locations are as follows:

- *Five (5) VOCs:*
  - *Benzene: EB-01 (4-5 feet), EB-02 (5.5-6 feet), Duplicate EB-02 (5.5-6 feet), EB-03D (5-6 feet);*
  - *Ethylbenzene: EB-01 (4-5 feet), EB-02 (5.5-6 feet), EB-02 (5.5-6 feet), EB-03D (5-6 feet), EB-10 (2.5-5 feet);*
  - *Naphthalene: EB-01 (4-5 feet), Duplicate EB-02 (5.5-6 feet), EB-03D (5-6 feet), EB-04D (4-5 feet), EB-04D (8-8.5 feet), EB-05S (6-7 feet), EB-07S (7.5-8 feet), EB-10 (2.5-5 feet)*
  - *Meta-xylene: EB-01 (4-5 feet), EB-10 (2.5-5 feet); and*
  - *Total xylenes: EB-01 (4-5 feet), EB-10 (2.5-5 feet).*
- *Two (2) SVOCs:*
  - *2-methylnaphthalene: EB-04D (4-5 feet); and*
  - *Naphthalene: EB-01 (4-5 feet), Duplicate EB-02 (5. 5-6 feet), EB-04D (4-5 feet), EB-04D (8-8. 5 feet), EB-10 (2. 5-5 feet).*
- *Eight (8) MDEQ VPH Compounds:*
  - *C5-C8 aliphatics: EB-01 (4-5 feet), EB-02 (5.5-6 feet), Duplicate EB-02 (5.5-6 feet), EB-03D (5-6 and 9-10 feet), EB-09S (6-7 feet), EB-10 (2.5-5 feet), EB-11S (2.5-3 feet);*
  - *C9-C12 aliphatics: EB-01 (4-5 feet), EB-02 (5.5-6) Duplicate EB-02 (5.5-6 feet), EB-03D (5-6 feet), EB-04D (4-5 and 8-8.5 feet), EB-09S (6-7 feet), EB-10 (2.5-5 feet), EB-11S (2.5-3 feet);*

- *C9-C10 aromatics: EB-01 (4-5 feet), EB-02 (5.5-6 feet), Duplicate EB-02 (5.5-6 feet), EB-10 (2.5-5 feet), EB-11S (2.5-3 feet);*
- *Benzene: EB-01 (4-5 feet), EB-02 (5.5-6 feet), Duplicate EB-02 (5.5-6 feet), EB-03D (5-6 feet), EB-10(2.5-5 feet);*
- *Ethylbenzene: EB-01 (4-5 feet), EB-02 (5.5-6 feet), Duplicate EB-02 (5.5-6 feet), EB-03D (5-6 feet), EB-09S (6-7 feet), EB-10 (2.5-5 feet), EB-11S (2.5-3);*
- *Naphthalene: EB-01 (4-5 feet), EB-02 (5.5-6 feet), Duplicate EB-02 (5.5-6 feet), EB-03D (5-6 feet), EB-04D (4-5 feet and 8-8.5 feet), EB-05S (6-7 and 11-12 feet), EB-07S (7.5-8 feet), EB-10 (2.5-5 feet), EB-11S (2.5-3 feet);*
- *Meta-xylene: EB-10 (2.5-5 feet); and*
- *Total xylenes: EB-10 (2.5-5 feet).*

- *Two (2) MDEQ EPH Compounds:*
  - *C9-C18 aliphatics: EB-02 (5.5-6 feet), Duplicate EB-02 (5.5-6 feet), EB-03D (5-6 feet), EB-04D (4-5 and 8-8.5 feet), EB-05S (6-7 and 11-12 feet), EB-06S (4.5-5 and 6.25-6.75 feet), EB-07S (7.5-8 feet), EB-10 (2.5-5 feet), EB-11S (2.5-3 feet), EB-15 (18-19 feet); and*
  - *C11-C22 aromatics: EB-04D (4-5 feet).*

Analytical results for inorganic compounds that exceeded regulatory criteria for direct contact in the Perched saturated zone in the East Rail Area at boring locations EB-03D, EB-11S, EB-14S and EB-15. The inorganic compounds that exceeded criteria and the respective locations are as follows:

- *Two (2) Inorganic Compounds:*
  - *Arsenic: EB-11S (2-2.5 feet), EB-14S (2-2.4 feet), EB-15 (18-19); and*
  - *Chromium: EB-03D (5-6 feet).*

Migration (Leaching) to Groundwater of Subsurface Soils (>2 feet)

Analytical results for organic compounds that exceeded regulatory criteria for migration to groundwater in soils within the Perched hydrostratigraphic unit for at least one compound at all sample locations in the East Rail Area. The organic compounds that exceeded migration to groundwater criteria and the respective locations are as follows:

- *Seven (7) VOCs:*
  - *Benzene: EB-01 (4-5 and 14-15 feet), EB-02 (5.5-6 feet), Duplicate EB-02 (5.5-6 feet), EB-03D (4-4.5, 5-6 and 9-10 feet), Duplicate EB-03D (4-4.5 feet), EB-04D (8-8.5 feet), EB-05S (6-7 feet), EB-09S (6-7 feet);*
  - *Ethylbenzene: EB-01 (4-5 feet), EB-02 (5.5-6 feet), Duplicate EB-02 (5.5-6 feet), EB-03D (5-6 feet), EB-10 (2.5-5 feet);*

- *Naphthalene: EB-01 (4-5 feet), EB-02 (5.5-6 feet), Duplicate EB-02 (5.5-6 feet), EB-03D (5-6 feet), EB-04D (4-5 and 8-8.5 feet), EB-05S (6-7 feet), EB-07S (7.5-8 feet), EB-10 (2.5-5 feet);*
- *Toluene: EB-10 (2.5-5 feet);*
- *Meta-xylene: EB-01 (4-5 feet), EB-10 (2.5-5 feet);*
- *Ortho-xylene: EB-10 (2.5-5 feet); and*
- *Xylenes (total): EB-01 (4-5 feet), EB-10 (2.5-5 feet).*

- *Three (3) SVOCs:*
  - *2-methylnaphthalene: EB-01 (4-5 feet), EB-02 (5.5-6 feet), Duplicate EB-02 (5.5-6 feet), EB-03D (5-6 feet), EB-04D (4-5 and 8-8.5 feet), EB-05S (6-7 and 11-12 feet), EB-07S (7.5-8 feet), EB-10 (2.5-5 feet), EB-11S (2.5-3 feet);*
  - *Naphthalene: EB-01 (4-5 feet), Duplicate EB-02 (5.5-6 feet), EB-04D (4-5 and 8-8.5 feet), EB-10 (2.5-5 feet), EB-11S (2.5-3 feet); and*
  - *Pentachlorophenol: EB-15 (15-16 feet).*

- *Eleven (11) MDEQ VPH Compounds:*
  - *C5-C8 Aliphatics: EB-01 (4-5 feet), EB-02 (5.5-6 feet), Duplicate EB-02 (5.5-6 feet), EB-03D (5-6 and 9-10 feet), EB-04D (8-8.5 feet), EB-09S (6-7 feet), EB-10 (2.5-5 and 7.5-8.5 feet), EB-11S (2.5-3 feet);*
  - *C9-C12 Aliphatics: EB-01 (4-5 feet), EB-02 (5.5-6 feet), Duplicate EB-02 (5.5-6 feet), EB-03D (5-6 feet), EB-04D (4-5 and 8-8.5 feet), EB-09S (6-7 feet), EB-10 (2.5-5 feet), EB-11S (2.5-3);*
  - *C9-C10 Aromatics: EB-01 (4-5 feet), EB-02 (5.5-6 feet), Duplicate EB-02 (5.5-6 feet), EB-03D (5-6 and 9-10 feet), EB-04D (4-5 and 8-8.5 feet), EB-05S (6-7 and 11-12 feet), EB-06S (6.25-6.75 feet), EB-07S (7.5-8 feet), EB-09S (6-7 feet), EB-10 (2.5-5 feet), EB-11S (2.5-3);*
  - *Benzene: EB-01 (4-5 feet), EB-02 (5.5-6 feet), Duplicate EB-02 (5.5-6 feet), EB-03D (4-4.5, 5-6 and 9-10 feet), Duplicate EB-03D (4-4.5), EB-04D (8-8.5 feet), EB-05S (6-7 feet), EB-09S (6-7 feet), EB-10 (2.5-5 feet), EB-11S (2.5-3 feet);*
  - *Ethylbenzene: EB-01 (4-5 feet), EB-02 (5.5-6 feet), Duplicate EB-02 (5.5-6 feet), EB-03D (5-6), EB-09S (6-7 feet), EB-10 (2.5-5 feet), EB-11S (2.5-3);*
  - *Methyl tert-butyl ether: EB-06S (6.25-6.75 feet), EB-09S (6-7 feet);*
  - *Naphthalene: EB-01 (4-5 feet), EB-02(5.5-6 feet), Duplicate EB-02 (5.5-6 feet), EB-03D (5-6 and 9-10 feet), EB-04D (4-5 and 8-8.5 feet), EB-05S (6-7 and 11-12 feet), EB-07S (7.5-8 feet), EB-10 (2.5-5 feet), EB-11S (2.5-3));*
  - *Toluene: EB-02 (5.5-6 feet), EB-10 (2.5-5 feet);*

- *Meta-xylene: EB-01 (4-5 feet), EB-02 (5.5-6 feet), EB-10 (2.5-5 feet);*
- *Ortho-xylene: EB-10 (2.5-5 feet); and*
- *Xylenes (total): EB-10 (2.5-5 feet).*

- *Two (2) MDEQ EPH Compounds:*
  - *C9-C18 Aliphatics: EB-02 (5.5-6 feet), Duplicate EB-02 (5.5-6), EB-03D (5-6 feet), EB-03 (5-6 feet), EB-04D (4-5 and 8-8.5 feet), EB-05S (6-7 and 11-12 feet), EB-06S (4.5-5 and 6.25-6.75 feet), EB-07S (7.5-8 feet), EB-10 (2.5-5), EB-11S (2.5-3 feet), EB-15 (18-19 feet); and*
  - *C11-C22 Aromatics: EB-02 (5.5-6 feet), Duplicate EB-02 (5.5-6 feet), EB-03D (5-6 feet), EB-04D (4-5 and 8-8.5 feet), EB-05S (6-7 and 11-12 feet), EB-06S (4.5-5 and 6.25-6.75 feet), EB-07S (7.5-8 feet), EB-10 (2.5-5 feet), EB-11S (2.5-3 feet), EB-15 (18-19 feet).*

In the East Rail, the most widespread impacts in the subsurface soil are benzene and naphthalene. These compounds are most prevalent near boring EB-03/MW-101 (Figure 14) and naphthalene in the vicinity of EB-04 (Figure 15).

Analytical results for inorganic compounds exceeded regulatory criteria for migration (leaching) to groundwater RBSLs in subsurface soil in the East Rail Area at boring locations EB-01, EB-07S, EB-11S, EB-14S and EB-15. The inorganic compounds that exceeded criteria and the respective locations are as follows:

- *Four (4) Inorganic Compounds:*
  - *Arsenic: EB-11S (2-2.5 feet), EB-14S (2-2.4 feet), EB-15 (18-19 feet);*
  - *Barium: EB-01 (14-15 feet), EB-07S (5.25-5.75 feet);*
  - *Copper: EB-11S (2-2.5 feet), EB-14S (2-2.4 feet); and*
  - *Lead: EB-15 (18-19 feet).*

5.3 *WEST RAIL AREA*

The parameters analyzed for in the West Rail Area soil samples and the process for identifying and screening for COPCs are the same as those previously described in Section 5.1. Soil analytical results are presented in Table 7 for the West Rail Area. The laboratory analytical reports and geotechnical analyses are attached as Appendix E.

5.3.1 Surface Soils (0-2 feet)

Perched zone surface soils at one location, WB-11D (1-2 feet), exceeded the direct contact COPC for C9-C18 aliphatics. There were two direct contact COPC exceedances for inorganic compounds in soils: arsenic and lead.

Arsenic concentrations at WB-01S (1.5-2 feet), WB-03S (0.5-1 feet) and WB-12S (0-1 feet) exceeded the MDEQ background value of 22.5 mg/kg, with the greatest arsenic concentration of 180 mg/kg measured at WB-01S (1.5-2 feet).

The MDEQ background value for lead is 29.8 mg/kg and the Commercial/Industrial USEPA RSL for lead is 800 mg/kg. Lead concentrations exceeded standards at WB-01S (1.5-2 feet) and WB03S (0-1 feet), with the greatest concentration of 1,200 mg/kg detected at WB-01S (1.5-2 feet).

Migration (Leaching) to Groundwater of Surface Soils (0-2 feet)

No VOCs or SVOCs exceeded migration to groundwater standards. For organic compounds by MDEQ VPH, C9-C10 aromatics exceeded its standard of 130 mg/kg at WB-11D (1-2 feet) (260 mg/kg) and benzene exceeded the MDEQ Tier 1 Surface Soil screening level of 0.07 mg/kg for migration to groundwater at WB-03S (0.5-1 feet) at a measured concentration of 0.093 J mg/kg. Per MDEQ EPH, C11-C22 aromatics exceeded its standard of 370 mg/kg at WB-11D (510 mg/kg).

For inorganic compounds, migration to groundwater standards were exceeded for seven (7) compounds:

- *Antimony [WB-01S (1.5-2 feet)];*
- *Arsenic [WB-01S (1.5-2 feet)], WB-03S [(0.5-1 feet) and WB-12S (0-1 feet)];*
- *Barium [WB-12S (0-1 feet)];*
- *Cadmium [WB-01S (1.5-2 feet) and WB-03S (0.5-1 feet)];*
- *Copper [WB-01S (1.5-2 feet)];*
- *Lead [WB-01S (1.5-2 feet) and WB-03S (0.5-1 feet)]; and*
- *Zinc [WB-01S (1.5-2 feet) and WB-03S (0.5-1 feet)].*

5.3.2 Subsurface Soils (>2 feet)

Analytical results for organic compounds exceeded regulatory criteria for direct contact in the West Rail Area Perched Saturated zone at seven borings (WB-01D, WB-02D, WB-04D WB-09D, WB-10, WB-11D, WB-12S) for a limited number of TPH carbon ranges for the MDEQ VPH and MDEQ EPH analytical suites. The organic compounds that exceeded direct contact criteria and the respective locations are as follows:

- *Three (3) MDEQ VPH Compounds:*
  - *C9-C12 aliphatics: WB-01D (6-6.5 feet), Duplicate WB-01D (6-6.5 feet), WB-02D (10-10.75 feet), WB-10 (3-4 feet), WB-11D (3-3.9 feet);*
  - *Ethylbenzene: Duplicate WB-01D (6-6.5 feet); and*
  - *Naphthalene: Duplicate WB-01D (6-6.5 feet).*

- *One (1) MDEQ EPH Compound:*
    - *C9-C18 aliphatics: WB-01D (3-4 feet and 6-6.5 feet), Duplicate WB-01D (6-6.5 feet), WB-02D (10-10.75 feet), WB-04D (8-9 feet), WB-09D (6-6.7 feet), WB-10 (3-4 feet), WB-11D (3-3.9 feet), WB-12S (2-2.5 feet), WB-15 (4-5 feet).*

Analytical results for inorganic compounds exceeded regulatory criteria for direct contact in soils in the West Rail Area at boring locations WB-04D (5-6 feet), WB-10 (6-7 feet), WB-13D (3-3.5 feet) and Duplicate WB-13D (3-3.5 feet). The inorganic compounds that exceeded criteria and the respective locations are as follows:

- *Two (2) Inorganic Compounds:*
    - *Arsenic: WB-04D (5-6 feet), WB-13D (3-3.5 feet), Duplicate WB-13D (3-3.5 feet); and*
    - *Total Chromium: WB-10 (6-7 feet).*

Migration (Leaching) to Groundwater of Subsurface Soils (>2 feet)

Analytical results for organic compounds that exceeded regulatory criteria for migration to groundwater in West Rail Area perched zone soil was limited to VOCs, MDEQ VPH and MDEQ EPH TPH carbon groups at only six boring locations (WB-01D (6-6.5 feet, 6-6.5 feet Field Duplicate), WB-02D (10-10.75 feet), WB-04D (8-9 feet), WB-10 (3-4 feet), WB-11D (3-3.9 feet), WB-15 (4-5 feet). The organic compounds that exceeded migration to groundwater criteria and the respective locations are as follows:

- *One (1) VOC:*
    - *Benzene: WB-02D (10-10.75 feet)*
- *Five (5) MDEQ VPH Compounds:*
    - *C5-C8 aliphatics: WB-01D (6-6.5 feet), Duplicate WB-01D (6-6.5 feet), WB-02D (10-10.75 feet);*
    - *C9-C10 aromatics: WB-01D (6-6.5 feet), Duplicate WB-01D (6-6.5 feet), WB-02D (10-10.75 feet), WB-04D (8-9 feet), WB-10 (3-4 feet), WB-11D (3-3.9 feet), WB-15 (4-5 feet);*
    - *Benzene: WB-02D (10-10.75 feet), WB-10 (3-4 feet);*
    - *Ethylbenzene: Duplicate WB-01D (6-6.5 feet); and*
    - *Naphthalene: WB-01D (6-6.5 feet), Duplicate WB-01D (6-6.5 feet), WB-11D (3-3.9 feet).*
- *One (1) MDEQ EPH Compound:*
    - *C11-C22 aromatics: WB-01D (6-6.5 feet, 6-6.5 feet Duplicate), WB-02D (10-10.75 feet), WB-11D (3-3.9 feet).*

Analytical results for inorganic compounds exceeded regulatory criteria for migration (leaching) to groundwater RBSLs in soil in the West Rail Area at boring locations WB-02D (2-2.5 feet), WB-03D (5-5.5 feet), WB-04D (5-6 feet), WB-06D (10-10.5 feet), WB-10 (6-7 feet and 9-9.5 feet), WB-13D (3-3.5 feet), Duplicate WB-13D (3-3.5 feet) and WB-14D (5-6 feet). The inorganic compounds that exceeded criteria and the respective locations are as follows:

- *Four (4) Inorganic Compounds:*
  - *Arsenic: WB-04D (5-6 feet), WB-13D (3-3.5 feet), Duplicate WB-13D (3-3.5 feet);*
  - *Barium: WB-03D (5-5.5 feet), WB-06D (10-10.5 feet), WB-10 (9-9.5 feet), WB-14D (5-6 feet);*
  - *Cadmium: WB-02D (2-2.5 feet); and*
  - *Zinc: WB-02D (2-2.5 feet).*

6. GROUNDWATER ANALTYICAL RESULTS

6.1 REGULATORY CRITERIA

Measured concentrations of detected COPCs in groundwater were compared to the respective Circular MDEQ-7 Montana Numeric Water Quality Standards (MDEQ-7 Standards). Measured concentrations of constituents for which MDEQ-7 standards have not been established, such as petroleum hydrocarbon fractions, were compared to the respective Montana RBCA RBSLs. Constituents with concentrations for which MDEQ-7 standards or RBSLs have not been established were compared to the respective USEPA RSLs. A summary of constituents in the Perched Unconfined and Upper Bedrock Semi-Confined hydrostratigraphic units (or cross connected wells) exceeding the above criteria are presented below.

6.2 EAST RAIL AREA

Groundwater analytical results are presented in Table 8 for the East Rail Area and laboratory analytical reports are provided in Appendix E. Benzene and naphthalene concentrations, the most widely distributed contaminants in the East Rail Area are plotted on Figure 14 and Figure 15, respectively.

6.2.1 Perched Unconfined Saturated Zone

Measured constituents exceeded regulatory criteria in groundwater obtained from wells installed in the Perched Unconfined hydrostratigraphic unit and locations interpreted to be cross connected between the Perched Unconfined and Upper Bedrock Semi-Confined hydrostratigraphic units (see Table 1). Exceedances were identified at ten sampling locations in the East Rail. These constituents included VOCs [benzene; 1,2-dichloroethane (1,2-DCA), ethylbenzene; and naphthalene], SVOCs (2,4-dimethylphenol; 2-methylnaphthalene, 2-methylphenol and naphthalene), inorganic metals (arsenic, barium, cadmium, chromium (total and cobalt) and petroleum hydrocarbon fractions (C11-C22 and C9-C10 aromatics and C19-C36, C5-C8, C9-C12 and C9-C18 aliphatics). Results are described in further detail below:

- *Seven (7) VOCs:*
  - *Benzene: EB-04D, EB-05S, EB-06, EB-07S, EB-09D, EB-10, MW-79S, MW-79D, MW-81S and MW-100;*
  - *1,2-DCA: EB-10, EB-14D, MW-79S, MW-79D, MW-100;*
  - *Ethylbenzene: EB-04D, EB-05S, EB-07S, EB-09D, EB-10, EB-11S, MW-79S, MW-79D, MW-81S, MW-100;*
  - *Naphthalene: EB-04D, EB-05S, EB-06, EB-07S, EB-09D, EB-10, EB-11S, MW-79S, MW-81S and MW-100;*
  - *Meta-xylene: EB-10, MW-79S;*
  - *Ortho-xylene: MW-79S; and*

- *Total xylenes: EB-10, MW-79S.*

- *Three (3) SVOCs:*
  - *2,4-dimethylphenol: EB-10, MW-79S;*
  - *2-methylnaphathalene: EB-04D, EB-07S, MW-79S, MW-81S and MW-100; and*
  - *Naphthalene: EB-04D, EB-06, EB-07S, EB-09D, EB-10, EB-11S, MW-79S, MW-81S, MW-99, MW-100.*

- *Nine (9) MDEQ VPH Compounds:*
  - *C5-C8 Aliphatics: EB-07S, EB-10, MW-79S, MW-79D;*
  - *C9-C12 Aliphatics: EB-07S, MW-79S;*
  - *C9-C10 Aromatics: EB-05S, EB-07S, EB-10, MW-79S;*
  - *Benzene: EB-04D, EB-05S, EB-06, EB-07S, EB-09D, EB-10, EB-11S, MW-79S, MW-79D, MW-81S, MW-100;*
  - *Ethylbenzene: EB-04D, EB-05S, EB-06, EB-07S, EB-09D, EB-10, EB-11S, MW-79S, MW-81S, MW-100;*
  - *Naphthalene: EB-04D, EB-05S, EB-06, EB-07S, EB-09D, EB-10, EB-11S, EB-14S, MW-79S, MW-81S, MW-100;*
  - *Meta-xylene: EB-10, MW-79S;*
  - *Ortho-xylene: MW-79S; and*
  - *Total xylenes: EB-07S, EB-10, MW-79S.*

- *Three (3) MDEQ EPH Compounds:*
  - *C19-C36 Aliphatics: EB-06, EB-07S;*
  - *C9-C18 Aliphatics: EB-06, EB-07S; and*
  - *C11-C22 Aromatics: EB-06, EB-07S and MW-100.*

- *Five (5) Inorganic Compounds:*
  - *Arsenic: EB-06, EB-07S, EB-09D, EB-10, EB-11S, EB-14S, MW-79S, MW-79D, MW-81S, MW-99, MW-100;*
  - *Barium: EB-06, MW-79S, MW-81S, MW-100;*
  - *Cadmium: EB-11S, EB-14S;*
  - *Total Chromium: EB-06, EB-09D, EB-10, MW-79S; and*
  - *Cobalt: EB-11S, MW-79D.*

6.2.2 Upper Bedrock Semi-Confined Saturated Zone

Measured constituents exceeded regulatory criteria in Upper Bedrock Semi-Confined hydrostratigraphic unit at three (out of four) sampling locations in the East Rail. Temporary monitoring well EB-05D did not produce enough groundwater for sample collection. Results are described in further detail below:

- *Four (4) VOCs:*
  - *Benzene: EB-07D, MW-81D;*
  - *1,2-DCA: EB-14D;*
  - *Ethylbenzene: EB-07D; and*
  - *Naphthalene: EB-07D.*
- *Two (2) SVOCs:*
  - *2-Methylnaphthalene: EB-07D; and*
  - *Naphthalene: EB-07D.*
- *Two (2) MDEQ VPH Compounds:*
  - *Benzene: EB-07D, MW-81D; and*
  - *Naphthalene: EB-07D, MW-81D.*
- *One (1) MDEQ EPH Compounds:*
  - *C9-C18 Aliphatics: EB-14D*
- *One (1) Inorganic Compounds:*
  - *Arsenic: EB-14D*

6.2.3 LNAPL

Only one well installed in the shallow fill, MW-101 (EB-03S) accumulated measurable LNAPL following installation (0.72 feet), while LNAPL slowly accumulated at EB-01/MW-79S and first appeared in 2019. Evidence of hydrocarbon impacts in the shallow fill (fill material staining, odor, elevated PID readings) were observed at most boring locations throughout the East Rail Area generally at a depth of 2-5 feet bgs. A hand augured boring, EB-02 had a thin layer of what appeared to be LNAPL (<0.01 feet) observed in the water in the borehole (6 feet deep borehole). Hydrocarbon sheens were observed during groundwater sampling in EB-05S and EB-06S.

No LNAPL was observed during the investigation within the deeper horizons during the RIAIM investigation below the dusky red siltstone in the immediate East Rail Loading Rack Area. Down-gradient from the East Rail Loading Area at MW-97 a sheen to approximately 0.01 feet of LNAPL has been observed in the perched unconfined zone. MW-97 was

installed in April 2019 for the groundwater monitoring program and is screened within the weathered dusky-red unit.

LNAPL sorbent socks are currently installed in MW-97, MW-70, MW-14R and MW-48 where a sheen has been observed.

6.2.3.1 LNAPL Baildown Testing Results

As indicated in Section 3.6.2, the only location in the East Rail Area with sufficient LNAPL thickness (0.72 feet) to conduct a baildown test was at MW-101 (formerly EB-03S). LNAPL baildown test data were processed and analyzed using the API LNAPL Transmissivity Workbook for Microsoft Excel™. The results indicate estimated LNAPL transmissivities of 1.9 square feet per day (ft^2/day) or 1.8E-01 square meters per second (m^2/sec) using the Bouwer and Rice (1976) method and 4.9 ft^2/day[17] or 4.6E-01 m^2/sec using the Cooper and Jacob (1946) method. LNAPL baildown test data and model best fit curves are presented in Appendix H.

The LNAPL transmissivity values for MW-101 fall within the range generally considered viable for active LNAPL recovery, but the associated areal extent of the recoverable hydrocarbon is questionable. Based on observations during drilling, the LNAPL originates in the fill just below a plastic liner approximately 5 feet bgs (elevated PID readings and wet fill material are noted to approximately 8 feet bgs underlain by dry, dusky-red, weathered siltstone/mudstone). MW-101 is located approximately 20 feet north, upslope from the north rail and the adjacent sewer line that runs parallel to the north side of the tracks. By contrast, MW-101 is located approximately 15 feet south of an east-west leg of the facility sewer that collects surface drainage and process water for delivery to the API for treatment. During installation of a new cleanout on the sewer at a junction to the east of MW-101, the excavation filled with LNAPL and water that appeared to be originating in the fill around the sewer piping. The volume was sufficient to require fluids management for the duration of the repair work. Based on these observations the LNAPL at MW-101 is more likely associated with the sewer piping and drainage in the fill around the piping than releases associated with the East Rail.

6.3 WEST RAIL AREA

Groundwater laboratory reports are provided in Appendix E and analytical results are presented in Table 9 for the West Rail Area. Benzene and naphthalene concentrations, the most widely distributed contaminants in the West Rail Area, are plotted on Figure 16 and Figure 17, respectively.

6.3.1 Perched Unconfined Saturated Zone

Measured constituents exceeded regulatory criteria in the Perched Unconfined hydrostratigraphic unit (or from wells screened across the Perched Unconfined and Upper

[17] LNAPL transmissivities in the range of 0.1-0.8 ft^2/day are considered threshold values for LNAPL recovery (ITRC LNAPL Update, Appendix C – Transmissivity (T_n) Appendix.

Bedrock Semi-Confined zones (i.e., cross-connected) at all but one sample location (WB-11D) in the West Rail Area (see Table 1). These constituents included the following:

- *Four (4) VOCs:*
  - *Benzene: WB-01S, WB-02S, WB-04S, WB-08, WB-09S, WB-10 and WB-11S);*
  - *1,2-DCA: WB-14D;*
  - *Ethylbenzene: WB-01S, WB-02S, WB-04S, WB-09S, WB-10, WB-11S, WB-12S; and*
  - *Naphthalene: WB-01S, WB-02S, WB-04S, WB-09S, WB-10, WB-11S.*
- *Two (2) SVOCs:*
  - *Naphthalene: WB-02S, WB-04S, WB-10, WB-11S; and*
  - *Pentachlorophenol: WB-01S.*
- *Five (5) MDEQ VPH Compounds:*
  - *C9-C12 Aliphatics: WB-11S;*
  - *C9-C10 Aromatics: WB-11S;*
  - *Benzene: WB-01S, WB-02S, WB-04S, WB-08, WB-09S, WB-10, WB-11S;*
  - *Ethylbenzene: WB-01S, WB-02S, WB-04S, WB-09S, WB-10, WB-11S, WB-12S; and*
  - *Naphthalene: WB-01S, WB-02S, WB-04S, WB-09S, WB-10, WB-11S and WB-12S.*
- *Two (2) MDEQ EPH Compounds:*
  - *C9-C18 Aliphatics: WB-02S, WB-04S, WB-08, WB-09S, WB-10, WB-11S, WB-12S; and*
  - *C19-C36 Aromatics: WB-10*
- *Four (4) Inorganic Compounds:*
  - *Arsenic: WB-02S, WB-03S, WB-04S, WB-05S, WB-06S, WB-07, WB-08, WB-09S, WB-10, WB-11S, WB-12S and WB-13S;*
  - *Barium: WB-10 and WB-11S;*
  - *Total Chromium: WB-01S, WB-06S, WB-08, WB-11S and WB-12S; and*
  - *Cobalt: WB-04S, WB-05S, WB-06S, WB-08, WB-09S and WB-12S.*

6.3.2 Upper Bedrock Semi-Confined Saturated Zone

Measured constituents exceeded regulatory criteria in the Upper Bedrock Semi-Confined hydrostratigraphic unit at two sampling locations (WB-03D and downgradient temporary

well, WB-13D) both located on the western portion of the West Rail Area. These constituents included the following:

- *One (1) SVOC:*
  - *Naphthalene: WB-03D*
- *One (1) MDEQ EPH Compounds:*
  - *C9-C18 Aliphatics: WB-03D*
- *Three (3) Inorganic Compounds:*
  - *Arsenic: WB-03D*
  - *Barium: WB-03D*
  - *Total chromium: WB-13D*

6.3.3 LNAPL

LNAPL accumulated on groundwater in temporary wells WB-01S (0.04 feet) and WB-02S (0.04 feet) installed in the perched horizon above the dusky red horizon at the bottom of the shallow fill. Evidence of lesser hydrocarbon impacts in the shallow fill (fill material staining, odor, elevated PID readings) were observed generally at a depth of 2-5 feet bgs at WB-04 (located near the current recovery wells where LNAPL recovery is ongoing) and south of the recovery wells, down slope surface grade and groundwater gradient, to the interceptor recovery trench at WB-08, WB-09, WB-10 and WB-11. Total fluids recovery is ongoing at the interceptor trench, LNAPL recovery estimates are included in the monthly reports. Based on the July 2019 site gauging data LNAPL was measured in the three operating recovery wells (MW-73, MW-75, and MW-76) with thicknesses ranging from 0.04-1.39 feet[18]. LNAPL is being monitored in monitoring well MW-74 where LNAPL thickness is minimal.

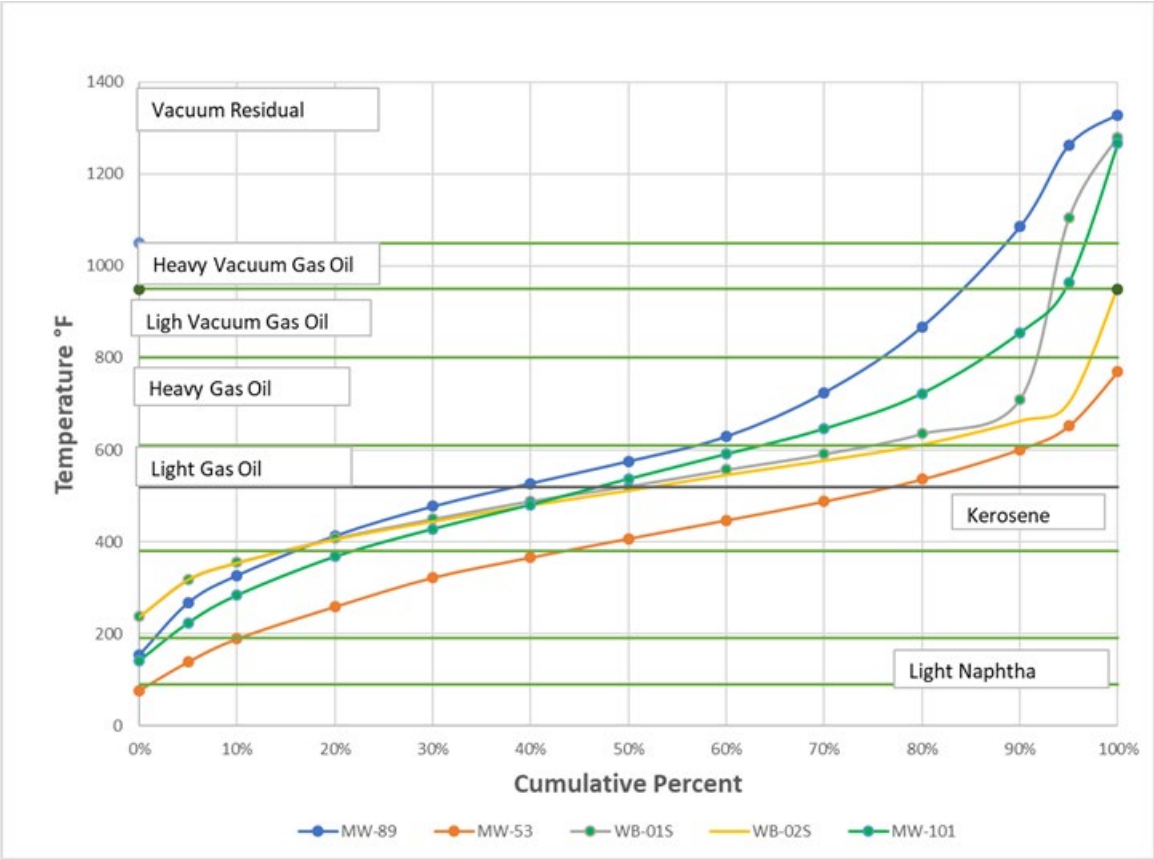
Due to the limited amount of LNAPL measured in the temporary wells in the West Rail Area, LNAPL Baildown Testing was not able to be performed. No LNAPL was observed during the investigation within the Upper Bedrock Semi-Confined stratigraphic unit in the West Rail Area.

6.4 LNAPL FINGERPRINTING RESULTS

As discussed in Section 3.5, LNAPL samples were collected from temporary monitoring wells from the West Rail Area (WB-01S and WB-02S) and a newly installed permanent monitoring well in the East Rail Area (EB-03S/MW-101) on June 24, 2019, and July 3, 2019, respectively. LNAPL fingerprinting samples were analyzed for total sulfur content (ASTM D2622), relative density (ASTM D4052), boiling range distribution (ASTM D7169) and light hydrocarbons in stabilized crude oils (ASTM D7900). The distillation curves for each sample location are shown in the chart below. Additional LNAPL sample locations (MW-53 and MW-89) are also plotted in the chart. These locations are not associated with

[18] July 2019 Monthly Interim Measures Report

the East or West Loading Rack; however, they are useful for comparative analysis.[19] The fingerprinting results are provided in Appendix C.



LNAPL samples collected from the West Rail Area (WB-01S and WB-02S) had similar characteristics with respect to their distillation curves and light hydrocarbon concentrations provided by ASTM D7900.[20] Each sample contains roughly 4% of the lower boiling compounds.[21] In addition, the paraffin, isoparaffin, aromatic, naphthene and olefin (PIANO) distributions are similar. Specific gravities are comparable between WB-01S (0.8382) and WB-02S (0.8436); however, the sulfur content is higher at WB-02S (1,130 mg/kg) compared to WB-01S (241 mg/kg). Overall, LNAPL from both West Rail Area locations display a strong resemblance to one other.

One LNAPL sample was collected from the East Loading Rack (EB-01/MW-101). The sulfur content at EB-03S/MW-101 (1.09%) was significantly higher compared to WB-01S (0.0241%) and WB-02S (0.113%). The East Rail Area location has an intermediate sulfur content and specific gravity compared to MW-89 (1.64% and 0.8876) and MW-53 (0.014% and 0.8047). EB-03S/MW-101 has a slightly higher specific gravity compared to the West

[19] MW-53, down-gradient of AOC 16 near the Truck Loading Rack, is representative of a heavy naphtha to light gas used in the production of gasoline, jet fuel, kerosene, and No. 2 diesel fuel products. MW-89 is representative of a medium to heavy crude.
[20] ASTM D7900 data provides a detailed breakdown of the low boiling fractions (C1 – C10).
[21] Lower boiling compounds refer to those that boil below 300°F.

Rail locations. The sulfur content in the LNAPL sample collected from the East Rail Area location is representative of a sour crude, while the sulfur content in the LNAPL samples collected from the West Rail Area locations are more representative of a sweet crude.[22] Based on sulfur content, LNAPL samples collected from MW-53 and WB-01S are similar to a low-sulfur diesel.[23]

The East and West Rail Area locations have distillation curves between MW-53 and MW-89. However, West Rail Area locations (WB-01S and WB-02) have a lower percentage of low boiling compounds at approximately 4%, compared to MW-89 (7% lower boiling compounds) and EB-03S/MW-101 (12% lower boiling compounds). MW-53 has much larger fraction of lower boiling compounds at approximately 29%.

In addition, LNAPL samples were also collected during the 1st Quarter 2020 (MW-97 and MW-101) and 3rd Quarter 2020 (MW-79D) groundwater sampling events in the East Rail Area (CMR 2020b and CMR 2020c). Based on the review of chromatogram and hydrocarbon peak ratios, LNAPL samples collected from MW-79S indicates a predominately gasoline signature whereas MW-97 indicates both gasoline and diesel signature. In MW-101, a gasoline and diesel signature are also observed and based on the presence of heavier hydrocarbons, may contain other refined (and possibly weathered) products obscured by the unresolved complex mixture (e.g., fuel oil), suggesting a mixture from multiple sources.

[22] A sweet crude contains less than 0.5% sulfur.
[23] A low-sulfur diesel contains less than 500 parts per million (ppm) (0.05%) sulfur and an ultra-low sulfur diesel contains less than 15 ppm (0.0015%) sulfur.

7. QUALITY ASSURANCE/QUALITY CONTROL

Following the lab analysis of all samples, Ramboll completed a separate Quality Assurance/Quality Control (QA/QC) review of the reported laboratory data in accordance with the Quality Assurance Project Plan (QAPP). This step (referred to generally as validation) consisted of an additional independent review of quality control information provided by the laboratory as well as quality control samples collected in the field by sampling staff. The review was equivalent to the Stage 2A validation as defined by USEPA (USEPA 2009). To ensure the validation process was consistent and rigorous a worksheet format was used to assess each sample delivery group report. Completed memorandums and worksheets are provided in Appendix D with the laboratory analytical reports. Validation principles and guidance were based on the USEPA National Functional Guidelines (USEPA 2017).

During the review, Ramboll did not find any significant data quality issues that effected the overall usability of the lab data. All results were acceptably complete and largely met the data quality objectives as laid out in the QAPP. Minor issues existed in some sample delivery groups (SDGs), but these issues were either isolated to non-constituents of concern or only affected a subset of sample results. These non-conformances are addressed individually in each SDG's validation worksheet and memorandum. Two common usability concerns seen in the project data and their implications are listed below:

- Blank Detections: In multiple SDGs some analytes were detected in blank samples, either within the laboratory analytical process or from the field. These blank detections indicate possible cross-contamination concerns. In general, these results were validated as non-detect as the source of the possible contamination could not be determined.
- Spike Recovery Non-Conformances: In multiple SDGs for multiple analytes some spike sample (matrix spikes, lab control spikes) recoveries were out of criteria. These out of criteria results indicate a possible accuracy bias. In order to account for this possible bias these results were validated as estimated.

Following the validation and usability review Ramboll summarized the results by applying validation qualifiers to the final result data. These qualifiers communicate the biases found during validation efforts. Qualifiers were uploaded to the project EQuIS database and will be presented with project results in all reporting and engineering tasks to ensure that all data users are aware of quality and usability limitations.

8. CONCLUSIONS AND RECOMMENDATIONS

In summary, the investigation revealed information that modifies our interpretation of the subsurface conditions in the Rail areas and the CMR site. Our understanding of the CSM and groundwater movement has changed substantially from our expectations during development of the RIAIM Work Plan. Also, the extent of LNAPL in the area was discovered to be far less than originally believed based on past investigations, particularly the results of the LIF/UVOST® investigation in 2017. Specific conclusions drawn from these investigative activities and associated recommendations are discussed below.

8.1 CONCLUSIONS

8.1.1 CSM

Previous investigation activities at the CMR facility have documented the presence of unconsolidated Pleistocene fluvial and lake deposits and various fill material at the ground surface immediately beneath the Site. These surficial units have been encountered at variable depths across the Site that range as much as 10-20 ft bgs. The fifth member of the Kootenai formation is encountered sitewide immediately beneath the surficial Pleistocene deposits and/or fill material. Based on the current understanding of the Site's geology, an updated CSM, included in Appendix A, identified two distinct hydrostratigraphic units that have been encountered at depth across the Site and overlie the shallowest potable aquifer present in the Great Falls area (Sunburst Sandstone Semi-Confined Aquifer) and regional limestone aquifer (Confined Madison Aquifer). The current understanding of the Site's hydrostratigraphy is as follows:

- *The **Perched Unconfined Saturated Zone** is a low yield hydrostratigraphic unit present within fill, glaciolacustrine deposits and/or poorly lithified mudstone/siltstone that contain various amounts of fine sand. The top of competent bedrock is encountered and appears laterally continuous across the Site as a dusky-red siltstone. The weathered portion of the dusky-red siltstone is moist and constitutes the base of the Perched Unconfined Saturated Zone. Due to the heterogenous nature of re-worked surficial deposits, perched groundwater was observed to be discontinuous. Groundwater elevations in the perched hydrostratigraphic unit shows a rapid response to infiltration of surface water from rain and/or snowmelt.*
- *The **Upper Aquitard** which hydraulically separates the overlying Perched Unconfined Saturated Zone and the underlying Upper Bedrock Semi-Confined Saturated Zone is comprised of the dry dusky-red siltstone. This unit is composed of a well lithified siltstone/mudstone interbedded with moderately to well cemented sandstone. The Upper Aquitard is continuous across the Site except for a few locations where it has been either removed by excavation or erosional processes. The low permeable strata of the aquitard impedes the hydraulic communication between the overlying Perched Unconfined Saturated Zone and the underlying Upper Bedrock Semi-Confined Saturated Zone.*

- *The **Upper Bedrock Semi-Confined Saturated Zone** is a low yield hydrostratigraphic unit underlying the Upper Aquitard and is composed of alternating layers of hard massive siltstone and/or shales with fine to very fine sandstone lenses and/or beds.*

Groundwater flow in the Perched Unconfined and Upper Bedrock Semi-Confined hydrostratigraphic units is south towards the Missouri River, located directly down-gradient of the Site. Perched Unconfined groundwater does not have an apparent connection to the adjacent Missouri River as the base of the perched saturated zone daylights to the riverbank above the level of the river. Upper Bedrock Semi-Confined groundwater may also daylight along the riverbank above the river level and/or may discharge into the riverbank below the level of the river.

The Updated CSM Report for the CMR facility, provided as Appendix A, presents the findings from an investigation of geologic outcrops along the northern bank of the Missouri River. Along with a literature review, the findings from the geologic outcrop investigation were integrated with previous field investigations, including a review of the boring logs and well construction information and historic groundwater elevations, down-gradient of the AOC-16 along North River Road, West Rail, East Rail and along the Missouri River.

8.1.2 Potential Historical Sources

There are 16 current or former SWMUs and AOCs in and surrounding the East Rail Area and five current or former SWMUs and AOCs in the vicinity of the West Rail Area. Historic releases from these SWMUs/AOCs are likely contributing to the impacts observed in these areas as demonstrated by the following:

- Historically, coal and/or ore material was transported by rail through the present-day East and West Rail Areas to the former Anaconda Copper Mining (ACM) Company Smelter and Refinery approximately 1 mile east of CMR, which is currently on the National Priorities List (NPL).
- The chlorinated VOC 1,2-DCA is present above the screening level in groundwater at the East Rail Area. This compound was used in leaded gasoline as a lead scavenger to prevent the buildup of lead deposits that foul internal combustion engine prior to the mid-1980s. 1,2-DCA was found in shallow groundwater in shallow well MW-79S and in deep groundwater in MW-79D, deep boring EB-10 and deep boring EB-14. 1,2-DCA was the only exceedance of screening levels in EB-14 (deep) and was not present in shallow groundwater at EB-14S.
- Several large gasoline spills, over 1,000 gallons, have been documented at AOC 12 (north of the East Rail Area). Five occurred between 1995 and 2001, one of which was over 10,000 gallons.
- Over 8,000 gallons of gas oil and water were released from the Refinery sewer system (SWMU 20) that runs through the East Rail Area in 2000.
- Two spills of over 1,000 gallons reached SWMU 9 (Oxidization Pond located north of the West Rail Area). A diesel spill in 2001 and a gas oil spill in 2013.

- In the late 1940s, the drainage ditch south of the East Rail Area present in 1922 has been dammed and a pond exists at this location.
- A small pond is present in the vicinity of EB15/MW-99 from the mid-1950s through the mid-1960s.
- By the early 1960s two impoundments are present at the current location of the onsite WWTP and an additional small pond has been added south of the original pond located east of the impoundments and west of the API separator/DAF units. The eastern most of these two impoundments corresponds to SWMU 1 (Diversion Pond).
- In the mid-1990s, the west impoundment is still present but the east impoundment is now circular in nature and appears to be in the current configuration of the open-top SWMU 3 (Wastewater Surge Tank). The west impoundment was decommissioned sometime before the mid-2000s.
- LNAPL fingerprinting conduct on product collected from MW-70 in 2017 showed that it was composed of a mixture of No. 2 fuel oil or diesel fuel and gasoline (or similar product). The sample also contained TEL indicating that at least a portion of the gasoline was an historic variant. The presence of TEL in the MW-70 LNAPL sample and presence of weathered or heavier fuel oil components suggests some contribution from both a recent release and historic gasoline release. LNAPL fingerprinting analytical results are provided in Appendix C.
- LNAPL fingerprinting samples collected as part of this investigation indicates, based on sulfur content, that the LNAPL present in the East Rail Area (EB-03/MW-101) is representative of a sour crude, while the sulfur content in the LNAPL samples collected from the West Rail Area locations (WB-01S and WB-02S) are more representative of a sweet crude or a low sulfur diesel. LNAPL from both West Rail Area locations (WB-01S and WB-02S) display a strong resemblance to one other. LNAPL fingerprinting analytical results are provided in Appendix C.
- *LNAPL samples collected since this 2019 work during the 1st Quarter 2020 (MW-97 and MW-101) and 3rd Quarter 2020 (MW-79D) groundwater sampling events in the East Rail Area (CMR 2020b and CMR 2020c) indicates the following: LNAPL at MW-79S has a predominately gasoline signature whereas at MW-97 both a gasoline and diesel signature are present. In MW-101, a gasoline and diesel signature are also observed and based on the presence of heavier hydrocarbons, may contain other refined (and possibly weathered) products obscured by the unresolved complex mixture (e.g., fuel oil), suggesting a mixture from multiple sources.*

8.1.3 Soil Impacts

All significant soil impacts in the rail areas are limited to the shallow lithologic zone (i.e., present in the upper 10 feet of heavily reworked material). Since this is the case and shallow groundwater has no connection to the adjacent Missouri River (receptor), an argument can be made that the migration (leaching) to groundwater criteria could be excluded for comparison. However, for the purposes of this report a discussion screening against these criteria has been included.

Elevated inorganics concentrations in the shallow soil horizon may in part be due to naturally elevated levels in site soil and/or historic rail operations.

EAST RAIL AREA

Surface Soil

- *The primary impacts for direct contact in the surface soil in the East Rail Area are associated with arsenic (EB-01, EB-07 and EB-10) and cobalt (EB-10).*
- *The primary impacts for migration (leaching) to groundwater are benzene (EB-10), antimony (EB-10), arsenic (EB-01, EB-07S and EB-10), barium (EB-02), cadmium (EB-10), silver (EB-10) and copper (EB-01, EB-10).*

Subsurface Soil

- *The impacts exceeding standards for direct contact in the subsurface soil in the East Rail Area are associated with organic compound classes VOC, SVOC, MDEQ VPH and MDEQ EPH and inorganic compounds arsenic and chromium.*
- *The impacts exceeding migration (leaching) to groundwater criteria include VOC, SVOC, MDEQ VPH and MDEQ EPH and inorganic compounds, arsenic, barium, copper, and lead.*

In the East Rail, the most widespread impacts in soil are benzene and naphthalene. These compounds are most prevalent near boring EB-03/MW-101 and naphthalene in the vicinity of EB-04.

WEST RAIL AREA

Surface Soil

- *The primary impacts for direct contact in the surface soil in the West Rail Area are limited to C9-C18 (WB-11D), arsenic (WB-01S, WB-03S, WB-12S) and lead (WB-01S, WB-03S).*
- *The primary impacts for migration (leaching) to groundwater are benzene at WB-03S, C9-C10 aromatics at WB-11D and C11-C22 aromatics at WB-11D (510 mg/kg). Inorganic COPCs for migration to groundwater include antimony (WB-01S), arsenic (WB-01S, WB-03S, WB-12S), barium (WB-12S), cadmium (WB-01S, WB-03S), copper (WB-01S), lead (WB-01S, WB-03S) and zinc (WB-01S, WB-03S).*

Subsurface Soil

- *The impacts exceeding standards for direct contact in the subsurface soil in the West Rail Area are associated with organic compound classes MDEQ VPH and MDEQ EPH and inorganic compounds arsenic and chromium.*
- *The impacts exceeding migration (leaching) to groundwater criteria include VOCs (benzene), MDEQ VPH and MDEQ EPH and inorganic compounds, arsenic, barium, cadmium, and zinc.*

The primary impacts in soil in the West Rail Area are associated with boring locations WB-01, WB-02, WB-10 and WB-11.

8.1.4 Groundwater Impacts

EAST RAIL AREA

Petroleum hydrocarbon impacts in the East Rail Area in both the Perched Unconfined and Upper Bedrock Semi-Confined hydrostratigraphic units or saturated zones are more prevalent in the eastern and central portions of the area than the western portion.

Perched Unconfined Saturated Zone

The discussion of the groundwater results from the Perched Unconfined Saturated Zone includes those borings and wells interpreted to be cross connected between the Perched Unconfined and Upper Bedrock Semi-Confined saturated zones.

- *No groundwater was measured (dry) in EB-09S. Abundant water was anticipated in this boring due to the sheet piling in the area that surrounds the onsite WWTP sludge tank. The sheet piling was thought to influence groundwater flow in the perched horizon and likely does on a very local level; however, an adjacent boring being dry illustrates the heterogeneous nature of the Perched Unconfined hydrostratigraphic unit and discontinuity of groundwater flow.*
- *A geo-fabric liner observed at 3 feet bgs in hand-augured boring EB-02 located between the rail tracks in the East Rail Area. It is not known how far the geotextile liner extends; however, groundwater was observed to be perched on this manmade surface and was observed to be daylighting to the south of the railroad ballast onto the vehicle road.*
- *Benzene and naphthalene are the primary contaminants in the Perched Unconfined Saturated Zone and were present above screening levels in most all the wells on the eastern and central portion of the East Rail Area. Groundwater samples from the following borings exceeded either or both COPC screening levels [EB-01S/MW-79S, EB-01D/MW-79D, EB-04S/MW-100, EB-04D, EB-05S, EB-06S/MW-81S, EB-06, EB-07S, EB-09D (cross connected) and EB-10 (cross connected)].*
- *Other VOCs and SVOCs present include ethylbenzene, 2,4-dimethylphenol, 2-methylnaphathalene and 1,2-DCA in EB01S/MW-79S; 2,4-dimethylphenol and 1,2-DCA in EB-10; 1,2-DCA in EB-01D/MW-79D; 2-methylnaphathalene in EB-07, EB-04D and EB-06S/MW-81S. The relevance of the 1,2-DCA in groundwater was previously discussed. It should be noted that 1,2-DCA was also present at a concentration below the screening level at EB-04S/MW-100.*
- *Petroleum hydrocarbon fractions were found in excess of screening levels at in the eastern and center portion of the East Rail Area at EB-05, EB-06, EB-07, EB-10, EB-04S/MW-100, EB01S/MW-79S and EB01D/MW-79D.*
- *Inorganics present in the Perched Unconfined groundwater in excess of screening levels include arsenic, barium, and cadmium. Arsenic and barium were in EB-06, MW-79S, MW-81S and EB-04S/MW-100. Arsenic and cadmium were found in EB-11*

and only cadmium in EB-14. Only arsenic was present in EB-01D/MW-79D, EB-10 and EB-15/MW-99.

Upper Bedrock Semi-Confined Saturated Zone

- *VOCs measured at concentrations exceeding relevant criteria include benzene and naphthalene in EB-06D/MW-81D and EB-07D, ethylbenzene in EB-07D and 1,2-DCA in EB-14D. The presence of 1,2-DCA being indicative of historic releases was previously discussed; however, the distribution of the 1,2-DCA in the deeper zone gives some insight as to the source. EB-14D is located on the western side of the East Rail Area in closest proximity to SWMU 11 (Past Leaded Sludge Oxidation Area South of Tank 52). 1,2-DCA was not present in perched groundwater at EB-14S.*
- *The SVOC 2-methylnaphathalene exceeded the screening level in EB-07D.*
- *Petroleum hydrocarbon fractions and the inorganic arsenic were measured above relevant criteria at EB-14D.*

WEST RAIL AREA

Petroleum hydrocarbon impacts in the West Rail Area are primarily limited to the Perched Unconfined Saturated Zone. These impacts are far less extensive than had been anticipated and are present at locations in close proximity to areas where LNAPL is present.

Perched Unconfined Saturated Zone

- *No groundwater was measured (dry) in the perched horizon borings WB-14S and WB-15 located south of the West Rail Area on the Great Falls WWTP property.*
- *Benzene is the primary contaminant found in groundwater in the West Rail Area. Not surprisingly the benzene concentrations are found in the boring closest to the LNAPL recovery wells (WB-01S, WB-02S, WB-04S) and along the interceptor trench (WB-08, WB-09S, WB-10, WB-11S).*
- *Though there were no exceedances of methyl tertiary butyl ether (MTBE) it was detected below screening levels in two shallow boring in the West Rail Area; WB-02S located near recovery wells on the northside of the area and WB-10 along the interceptor trench. MTBE an octane enhancer additive in gasoline that was widely used from 1992 through the mid-2000s as a replacement for lead. The lead scavenger 1,2-DCA was found in WB-14D located south of the West Rail Area.*
- *Petroleum hydrocarbon fractions in excess of screening levels are limited to the borings closest to the LNAPL recovery wells (WB-01S, WB-02S) and along the interceptor trench (WB-08, WB-09S, WB-10, WB-11S, WB-12S).*
- *Arsenic is the primary inorganic present in the perched horizon in the West Rail Area. It was present in excess of the screening level in all shallow borings completed within this zone except for WB-01S. Also found in excess of screening levels was barium in WB-10 and WB-11, total chromium in WB-01S, WB-06S, WB-8, WB-11S and WB-12S and cobalt in WB-04S, WB-05S, WB-6S, WB-08, WB09S and WB-12s).*

Upper Bedrock Semi-Confined Saturated Zone

- *Groundwater samples were collected from two of the six borings advanced into the Upper Bedrock Semi-Confined Zone. The other borings were dry (WB-02D, WB-04D, WB-06D and WB-09D).*
- *Naphthalene, petroleum hydrocarbon fractions and the inorganics arsenic and barium exceed screening levels the groundwater samples collected from WB-03D, the northwestern most location in the West Rail Area.*
- *Total chromium exceeds its screening level in downgradient location WB-13D.*
- *Given the remote locations and depth, the inorganics in these boring may be related to sources unrelated with the West Rail Area.*

8.1.5 Occurrence of LNAPL

EAST RAIL AREA

LNAPL was only present in one of the borings/monitoring wells (EB-03/MW-101) installed as part of this rail investigation and in MW-79S which was replaced as part of this effort. In MW-101 LNAPL was originally measured at 0.85 feet. The presence of free product has been continuous in the western portions of the East Rail at MW-79S and MW-101 throughout all groundwater monitoring events which ended in first quarter 2021. No LNAPL was observed during the investigation within the Upper Bedrock Semi-Confined zone during the RIAIM investigation in the immediate East Rail Area. Down-gradient from the East Rail Loading Area at MW-97 a sheen to approximately 0. 01 feet of LNAPL has been observed in the perched unconfined zone.

Based on recent chromatograms and hydrocarbon peak ratios, LNAPL samples collected from MW-79S indicates a predominately gasoline signature whereas MW-97 indicates both gasoline and diesel signature. In MW-101, a gasoline and diesel signature are also observed and based on the presence of heavier hydrocarbons, may contain other refined (and possibly weathered) products obscured by the unresolved complex mixture (e.g., fuel oil), suggesting a mixture from multiple sources. This fact, along with the fact that the when the new sewer clean out was installed in the area near MW-101, the trench filled with a product/water mixture, indicates that the source of the LNAPL in MW-101 may be from recent releases associated with the refinery sewer line.

The LNAPL transmissivity values for MW-101, calculated from the baildown tests performed as part of this investigation, fall within the range generally considered viable for active LNAPL recovery.

WEST RAIL AREA

LNAPL accumulated on groundwater in WB-01S and WB-02S at 0. 04 feet in both. These two borings are nearest to recovery wells MW-73, MW-75, and MW-76. LNAPL was measured at 0. 09 feet in MW-73, 0.83 feet in MW-75 and 0.94 feet in MW-76 during the

August 3rd quarter groundwater monitoring. LNAPL within the West Rail Area is defined as a sweet crude or a low sulfur diesel.

8.1.6 Contaminant Migration

Groundwater within the Perched Unconfined Saturated Zone does not have an apparent connection to the adjacent Missouri River, nor does there appear to be substantive vertical migration of the groundwater through the dry dusky red Upper Aquitard unit to the Upper Bedrock Semi-Confined Saturated Zone units. Therefore, contaminant migration via perched groundwater is limited.

Groundwater flow in the Perched Unconfined and Upper Bedrock Semi-Confined hydrostratigraphic units is south towards the Missouri River, located directly down-gradient of the Site. Perched groundwater does not have an apparent connection to the adjacent Missouri River as the base of the perched saturated zone daylights to the riverbank above the level of the river. Upper Bedrock Semi-Confined groundwater may also daylight along the riverbank above the river level and/or may discharge into the riverbank below the level of the river. Hydraulic conductivities measured in the down-gradient wells near the river are quite low, indicative of a silt or possibly cemented sand. These low hydraulic conductivities minimize the volume of impacted groundwater reaching the river.

8.2 RECOMMENDATIONS

Based on the results of this and previous investigative work in the rail areas and the conclusions presented above IM response actions recommended for the East and West RIAs are fairly limited. Specifically, CMR makes the following recommendations regarding path forward:

EAST RAIL AREA

LNAPL/Source Area

Continue the recovery activities using sorbent socks that are currently installed in MW-97, MW-70, MW-14R and MW-48 in and downgradient of the East Rail. Consider LNAPL recovery activities using sorbent socks at MW-79S and MW-101 if LNAPL thicknesses increase.

Further evaluate the sewer line (SWMU 20) in the vicinity of MW-101S to determine if releases from this sewer line are the source of the LNAPL observed in this well. If confirmed as the source, repair of the sewer line (SWMU 20) in the vicinity of MW-101 is recommended.

Soil

CMR has developed a soil management plan to guide any potential excavation and utility work in the East Rail Area for the purposes of limiting exposure to contaminants by construction workers and to appropriately manage the waste soil generated.

Determine appropriate facility-specific background concentrations in shallow soil as part of the upcoming RFI, with the collection of background samples from unimpacted areas that are representative of natural conditions. The background data collected will be used to evaluate if the elevated inorganic concentrations in the shallow soil horizon are at least in part naturally occurring background levels.

Groundwater

No additional actions are recommended regarding impacted groundwater at this time. The following activities are anticipated to be included as part of the upcoming RFI:

- *Characterization of the groundwater quality in the Upper Bedrock Semi-Confined Saturated Zone down-gradient of the East Rail;*
- *Abandonment and replacement of one crossed connected monitoring well (MW-91) with one monitoring well cluster to be installed in the Perched and Upper Bedrock Saturated Zones (MW-91S/MW-91D); and*
- *Installation of one Upper Bedrock Saturated Zone monitoring well (MW-79D2).*

WEST RAIL AREA

LNAPL/Source Area

Operation of the existing product recovery system should continue. The system was recently upgraded (October 2020) with the addition of skimmer pumps to replace the total fluid recovery pumps. Further evaluation of potential upgrades related to the system, both the wells and the interceptor trench, to include valving so that product recovery volumes from each well and the trench can be measured separately. Based on the recovery information, the need for any additional upgrades to the system in this area may need to be assessed.

Soil

CMR has developed a soil management plan to guide any potential excavation and utility work in the West Rail Area for the purposes limiting exposure to contaminants by construction workers and to appropriately manage the waste soil generated.

Determine appropriate facility-specific background concentrations in shallow soil as part of the upcoming RFI, with the collection of background samples from unimpacted areas that are representative of natural conditions. As with the East Rail Area, the background data collected will be used to evaluate if the elevated inorganics concentrations in the shallow soil horizon are at least in part naturally occurring background levels.

Groundwater

No additional actions are recommended regarding impacted groundwater. However, as part of the upcoming RFI CMR it is anticipated that characterization of the groundwater quality in the Perched Unconfined Saturated Zone down-gradient of the West Rail will be included.

1) Concentrations in **red boldface** exceed the MTDEQ - 7 Human Health Standards for groundwater
2) The reported naphthalene results are from USEPA 8260B Method (VOCs).
3) All results are reported in (µg/L).

NOTES:

Table updated in September 2021.

AMSL: Above mean sea level
BOTC: Below top of casing
TOC: Top of casing
TOS: Top of screen
BOS: Bottom of screen
--: Not measured
ft: feet

[1] Survey information provided by TD&H Engineering July 2019, vertical datum coordinates provided in North American Vertical Datum 1988 corrected to the Montana State Plane Coordinate System.

[2] Monitoring well screen intervals are identified as the following: "perched" unconfined wells, "upper bedrock" semi-confined wells, or cross-connected wells. The perched and upper bedrock units are separated by a shallow aquitard (i.e. a dry dusky-red unit composed primarily of silts and clays).

[3] Groundwater elevations were corrected for free product thicknesses at MW-101. The correction factor was determined by thickness of the free product multiplied by the specific gravity. Specific gravity results for MW-101 (0.8641) were determined by SGS North America Inc. Due to proximity and visual appearance, the correction factor determined at monitoring wells with known specific gravity measurements were applied to other monitoring wells with the presence of LNAPL, as follows:
- MW-101 applied to MW-79S; and
- WB-01 and WB-02 (0.84) collected during the 2019 RIAIM Field Investigation applied to MW-73, MW-74, MW-75, and MW-76.

NOTES:

Table updated in September 2021.

The bailer dimension used to conduct slug testing = 3 feet X 0.125 feet. These dimensions are estimated to displace approximately 0.28 gallons or 1.7 feet of water in a 2 inch diameter well.

Submersible pump used to initiate slug tests in EB-09D and EB-10.

Pneumatic method used to initiate slug tests in EB-07S and EB-11.

cm/sec: Centimeters per second

DTW: Depth to water

KGS: Kansas Geological Survey

* The pneumatic slug testing apparatus used to conduct slug testing at EB-07S and EB-11S did not function properly, as a result the hydraulic conductivity values calculated for EB-07S and EB-11S were typical for unconsolidated gravel or clean sand, respectively (Freeze and Cherry, 1979) and are not consistent with the fine grain material that the wells were screened in at the time of slug-testing. Therefore the calculated values do not suggest a representable value, as such these data points have been excluded from the average calculations.

[1] Monitoring well screen intervals are identified as the following: "perched" unconfined wells, "upper bedrock" semi-confined wells, or cross-connected wells. The perched and upper bedrock units are separated by a shallow aquitard (i.e. a dry dusky-red unit composed primarily of silts and clays).

[2] The Bouwer-Rice model is useful for determining the hydraulic conductivity of an unconfined aquifer.

[3] The KGS model is useful for determining the hydraulic conductivity of unconfined and nonleaky confined aquifers.

[4] Insufficient water displacement in WB-03S due to small water column length; no hydraulic conductivity estimate.

TABLE 6
EAST RAIL SOIL ANALYTICAL RESULTS
Calumet Montana Refining, LLC - Great Falls, Montana

Soil Notes:

Table updated in September 2021.

1 All concentrations are presented in mg/kg (ppm).
2 Only compounds with at least one detection each respective area are shown.
3 Inorganic concentrations below the Background Threshold Values for Inorganics in Montana Soils are not identified as exeedances.
4 The USEPA Commercial/Industrial RSLs are based on a Target Risk of $1x10^{-6}$ and a Target Hazard Quotient of 0.1;
C - Carcinogen; NC - Noncarcinogen
5 The Direct Contact Screening Level is selected according to the MTDEQ Surface and Subsurface Soil Screening Flowchart.
6 The MTDEQ Modified EPA Migration to Groundwater Screening Levels are selected according to the MT DEQ Surface and Subsurface Soil Screening Flowchart, a DAF of 10 has been applied to these screening levels;
RSL-MCL - The RSL-MTGW is based on the MCL;
MT-Scaled - The risk-based screening level was scaled to match the MT DEQ HHS groundwater target per the Surface and Subsurface Soil Screening Flowchart.
7 The Leaching to Groundwater Screening Level is selected according to the MTDEQ Surface and Subsurface Soil Screening Flowchart Process.
8 Concentrations that exceed the Direct Contact RBSL are **boldfaced** and gray shaded.
9 Concentrations that exceed the Leaching to Groundwater RBSL are <u>underlined</u> and gray shaded.

Abbeviations:

U -- Not Detected.
J -- Estimated Concentration.
H -- Analysis Conducted Outside Holding Time.
B -- Blank Contamination.
( ) -- Detection Limit.
-- -- Not Analyzed.

TABLE 7
WEST RAIL SOIL ANALYTICAL RESULTS
Calumet Montana Refining, LLC - Great Falls, Montana

Soil Notes:

Table updated in September 2021.

1All concentrations are presented in mg/kg (ppm).

2Only compounds with at least one detection each respective area are shown.

3Inorganic concentrations below the Background Threshold Values for Inorganics in Montana Soils are not identified as exeedances.

4The USEPA Commercial/Industrial RSLs are based on a Target Risk of $1x10^{-6}$ and a Target Hazard Quotient of 0.1;

C - Carcinogen; NC - Noncarcinogen

5The Direct Contact Screening Level is selected according to the MTDEQ Surface and Subsurface Soil Screening Flowchart.

6The MTDEQ Modified EPA Migration to Groundwater Screening Levels are selected according to the MT DEQ Surface and Subsurface Soil Screening Flowchart, a DAF of 10 has been applied to these screening levels;

RSL-MCL - The RSL-MTGW is based on the MCL;

MT-Scaled - The risk-based screening level was scaled to match the MT DEQ HHS groundwater target per the Surface and Subsurface Soil Screening Flowchart.

7The Leaching to Groundwater Screening Level is selected according to the MTDEQ Surface and Subsurface Soil Screening Flowchart Process.

8Concentrations that exceed the Direct Contact RBSL are **boldfaced** and gray shaded.

9Concentrations that exceed the Leaching to Groundwater RBSL are <u>underlined</u> and gray shaded.

Abbreviations:

U -- Not Detected.

J -- Estimated Concentration.

H -- Analysis Conducted Outside Holding Time.

B -- Blank Contamination.

( ) -- Detection Limit.

-- -- Not Analyzed.

TABLE 8
EAST RAIL GROUNDWATER ANALYTICAL RESULTS
Calumet Montana Refining, LLC - Great Falls, Montana

Groundwater Notes:

*Table updated in September 2021**.***

1 All concentrations are presented in ug/L (ppb).
2 Only compounds with at least one detection are shown.
3 Concentrations that exceed the MDEQ-7 Human Health Standards - Groundwater are **boldfaced.**
4 Concentrations that exceed the MDEQ Tier 1 Groundwater RBSLs are gray shaded.
5 Concentrations that exceed the USEPA Regional Screening Levels - Resident Tapwater are underlined.

Abbreviations:

U -- Not Detected.
J -- Estimated Concentration.
H -- Analysis Conducted Outside Holding Time.
B -- Blank Contamination.
( ) -- Detection Limit.
-- -- Not Analyzed.

Groundwater Notes:

Table updated in September 2021.

1 All concentrations are presented in ug/L (ppb).
2 Only compounds with at least one detection are shown.
3 Concentrations that exceed the MDEQ-7 Human Health Standards - Groundwater are **boldfaced.**
4 Concentrations that exceed the MDEQ Tier 1 Groundwater RBSLs are gray shaded.
5 Concentrations that exceed the USEPA Regional Screening Levels - Resident Tapwater are underlined.

Abbreviations:

U -- Not Detected.
J -- Estimated Concentration.
H -- Analysis Conducted Outside Holding Time.
B -- Blank Contamination.
( ) -- Detection Limit.
-- -- Not Analyzed.

1. INTRODUCTION

Ramboll US Consulting, Inc. (Ramboll), on behalf of Calumet Montana Refining, LLC (CMR), has prepared this Updated Conceptual Site Model (CSM) Report for the Calumet Great Falls Montana Refining facility located at 1900 10th Street NE, Great Falls, Montana (Site) (Figure 1). This report presents the findings from an investigation of geologic outcrops along the northern bank of the Missouri River. Along with a literature review, the findings from the geologic outcrop investigation were integrated with previous field investigations, including a review of the boring logs and well construction information and historic groundwater elevations, down-gradient of the Area of Concern (AOC)-16 Area along North River Road, West Rail Loading Area (West Rail), East Rail Loading Area (East Rail), and along the Missouri River. Based on the above, this report presents an updated CSM of the geology and hydrogeology associated with the Site. Locations of the exposed outcrops and associated geologic units mapped and compiled by the Montana Bureau of Mines and Geology (MBMG) and US Geological Survey (USGS) are shown in Figure 2 (MBMG 2002). A series of cross-sections were generated, as shown in Figure 3, to illustrate the geologic units with depth in the AOC-16 Area (Figure 4), East Rail (Figure 5), and along the Missouri River (Figure 6). In addition, locations of the exposed outcrops near the monitoring wells down-gradient of AOC-16 along North River Road, are shown in Figure 4. A representative stratigraphic column based on the updated CSM is shown in Figure 7. Boring logs for select monitoring wells (i.e., MW-41S/D, MW-71, MW-72, MW-61S/D, MW-62, MW-79D, MW-81D, MW-97, MW-98, MW-99, MW-105, and WB-14D) discussed in this report and/or used to generate the cross-sections in Figures 4-6 which support the revisions to the CSM, are included as Appendix A and shown in Figure 3.

2. GEOLOGIC BACKGROUND

2.1 REGIONAL GEOLOGY

The North American Cordilleran Orogeny led to the development of the Cordilleran Foreland Basin System and associated sedimentary deposits. These sedimentary deposits have been the focus CMR geologic investigations. The archetypal collision of the North American Cordilleran fold and thrust belt lies to the west of present day Great Falls, Montana, and represents the collision of oceanic and continental lithosphere as the North American Continental Plate overrode the oceanic Kula-Farallon Plate during the Late Jurassic into the Early Cretaceous Period (beginning approximately 150 million years ago) (Reid 2015).

A non-marine, foreland basin system developed to the east of the topographic load of the North American Cordilleran Orogenic Belt, the associated foredeep of the foreland basin system infilled with fluvial and estuarine-dominated sediment deposits during the Early Cretaceous that thinned eastward, away from the collision boundary, meanwhile a forebulge emerged to the east of where the city of Great Falls, Montana, is located today (Reid 2015).

The fluvial and estuarine deposits of the foreland basin system are dominated by silts and sands of the Kootenai Formation which represents the lithology that underlies the city of Great Falls and the CMR facility. The Kootenai Formation has informally been differentiated into fifth member (Kk5 – shallowest and youngest), an upper and lower fourth (Kk4 – older and underlying the Kk5), which is underlain by a member known as the Sunburst Sandstone (Reid 2015).

The fifth member of the Kootenai Formation is distinguished by red-weathered mudstone that contains lenses and beds of brownish-gray and greenish-gray, cross-bedded, micaceous sandstone and light gray nodular limestone concretions. The lower part contains a dark-gray shale and lignite bed with a significant pre-angiosperm flora. Thickness of the fifth member is estimated to be approximately 230 feet (Reid 2015).

The upper strata of the fourth member of the Kootenai Formation, which directly underlies the fifth member, has been identified as brownish-gray limestone and interbedded shale. The limestone contains ostracods and brackish water dinoflagellates (Burden 1984). The lower portion of the fourth member of the Kootenai Formation has been identified as sandstones interbedded with very dark reddish-brown mudstones that contain brackish water dinoflagellates (Burden 1984). The sandstones of the lower portion range from dusky-red to pale reddish-brown, fine-to medium-grained, platy, thin- to medium-bedded. Large channels cut through the lower portion of the fourth member unit and channel fill has been observed to be mudstone, interbedded sandstone and mudstone, or sandstone deposits (Hopkins 1985). The approximate thickness of the fourth member of the Kootenai Formation has been estimated to be as much as 200 feet.

The Sunburst Member (Kks) is one of the lowest (oldest) units of the Kootenai Formation that outcrops near present day Great Falls, Montana, and is typically a light, yellowish-brown, well sorted, well cemented, resistant quartz sandstone with interspersed limonite specks. Sedimentary structures include cross bedding and ripple lamination (Reid 2015). A

modified stratigraphic section of the Great Falls area and CMR hydrostratigraphic units are presented in Table 1.

2.2 GEOLOGIC INTERPRATIONS OF PREVIOUS FIELD INVESTIGATIONS

In 2019 and 2020, Ramboll geologists logged and characterized the varied shallow lithological units underlying CMR. The boring logs and monitoring well construction information, including soil and groundwater analytical data, have been presented in the following reports:

- Rail Investigation Area Interim Measures (CMR 2019a);
- 3rd Quarter 2019 Groundwater Sampling Summary Report (CMR 2019b);
- AOC-16 Pilot Study Evaluation Report (CMR 2020a);
- 2019 Annual Groundwater Sampling Summary Report (CMR 2020b);
- 3rd Quarter 2020 Groundwater Sampling Summary Report (CMR 2020c);
- AOC-16 Interim Measures Final (100%) Design Report (CMR 2020d); and
- 4th Quarter 2020 Groundwater Sampling Summary Report (CMR, 2021).

Previous subsurface investigations at the Site have utilized a variety of drilling methods including direct push, hollow stem auger, air rotary and sonic. All drilling methods with the exception for air rotary and sonic drilling resulted in borehole refusal at a hard dusky-red unit. The sonic drilling method was selected by Ramboll because this method offered more advanced drilling capabilities including, improved sample recovery that resulted in a better representation and correlation of grain size descriptions with depth. Grain size descriptions obtained during previous drilling operations were compared to and correlated with the geologic outcrops that were observed along the Missouri River. An updated CSM and a representative stratigraphic column at CMR are discussed in more detail in Section 4.1.

A brief synopsis of the geologic findings from different investigated areas are presented in the sections below. This report provides an updated geological context, formation descriptions, and hydrogeological unit descriptions and presents an updated CSM.

2.2.1 AOC-16 Area

The lithology of the AOC-16 Area has been presented in multiple reports (CMR 2020a, CMR 2020c, CMR 2020d). Approximately the top 5 feet of material is composed of fill and/or reworked material consisting of gravels with varying amounts of fine sand and silt. Beneath the fill material is a fine sand that extends down to a thinly bedded sandstone unit and/or moderately laminated hard gray silt. The silt had various amounts of fine sand and featured yellow mottling. Beneath the sandstone and hard gray silt is the first appearance of the weathered and mottled dusky-red siltstone unit. Hydrocarbon odor and staining, including overall sand content, decreased with depth. Along North River Road, a thin bed of strongly cemented sandstone and weakly laminated dusky-red siltstone/mudstone were encountered, which did not exhibit signs of groundwater (i.e., moisture content or mottling). The deepest boring (MW-41D), advanced to 35 feet, identified a gray to dark gray siltstone/shale beneath dry upper aquitard unit (i.e., dusky-red siltstone with interbedded sandstone).

Table 2 presents the lithological units present along North River Road (CMR 2020d). The distinct lithological units presented in Table 1 appear to be laterally continuous (west to east), but the strongly cemented sandstone unit 4 appears to pinch out to the south, which is shown in Figure 4.

2.2.2 West Rail

As presented in the Rail Investigation Area Interim Measures (RIAIM) (CMR 2019a), heterogeneous geologic conditions were encountered at the West Rail associated with approximately the top 10 feet of material (shallow horizon) were encountered. These were composed of fill and/or reworked material consisting of gravels with varying amounts of sands, silts and clays. This material is heterogeneous and non-continuous; but overall grain size fines with depth from some gravels and sands to silts and clays. In the West Rail, the first foot consists of ballast stone underlain by gravelly sands that fined with depth to silty sands and sandy clays. Logging the fill material in the first 10 feet was difficult due to poor recovery of the sands and gravels that tended to fall out of the drill stem during the drilling process. In borings advanced within the ditch along the West Rail or within the property boundary of the wastewater treatment plant (southern borings) only the first 1-5 feet are composed of fill material.

The shallow horizon was underlain by a weakly to well laminated dusky red unit that extended to depths of approximately 15-20 feet below ground surface (bgs). In the southern borings, the shallow horizon is underlain by a weakly laminated, dusky red unit that extended to depths of 16-28 feet bgs. This dusky-red unit is interpreted as the weathered siltstone or mudstone that represents the top of bedrock. The dusky red unit is underlain by hard or well laminated siltstones and/or mudstones (to depths ranging from 25-33 feet bgs). The well laminated unit and harder, typically more massive units were occasionally interbedded. Strongly cemented sandstone was encountered near the terminal depth of the borings.

The deepest boring (WB-14D), advanced to 40 feet bgs with a bottom elevation of approximately 3,281 ft above mean sea level (amsl), within the wastewater treatment plant, identified laminated siltstones beneath the sandstone.

2.2.3 East Rail

Approximately the top 10 feet of material at the East Rail is composed of fill and/or reworked material consisting of gravels with varying amounts of sands, silts and clays (CMR 2019a). This material is heterogeneous and non-continuous; but overall grain size fines with depth from some gravels and sands to silts and clays. Within this shallow horizon (first 10 feet of material) there is typically staining within the first 5 feet of material and strong hydrocarbon odors observed within the upper 10 feet.

The shallow horizon is directly underlain by a dry dusky red unit composed primarily of silts and clays that extend to depths ranging from 15-20 feet bgs (hydrocarbon odors and elevated photoionization detector (PID) readings were present to 20 feet in some locations). This unit was often weakly laminated to moderately laminated, any moisture in the dusky

red unit was typically associated with mottled coloration on the more clay-rich portions. As mentioned in Section 2.2.1, this unit is interpreted as a weathered siltstone and/or mudstone. This dusky red unit was observed throughout the East Rail with the exception boring EB-15 (converted to MW-99) located offsite adjacent to the river walk. Fill was present in EB-15 to a depth of almost 20 feet bgs as illustrated by the presence of an asphalt cobble identified at 19.5 feet bgs. Based on relative depths of the dusky-red siltstone unit, the absence is likely due to the removal of this unit due to the construction of the 10th Street NE bridge and/or erosional processes.

Immediately below the dusky red unit are alternating layers of hard, massive and well laminated siltstones and mudstones. The massive siltstones/mudstones were observed to have moisture associated with the mottled red and gray coloration portions. Within the laminated siltstones/mudstones there are often fine to very fine sandstone lenses or layers. Laminated sands and silts were identified near the terminal depth of several borings and likely represent very dense to well-cemented sandstones in some cases.

Two geologic cross-sections from the southern portion of the East Rail, extending to the bank of the Missouri River, are shown in Figure 5.

2.2.4 Along the Missouri River

Based on the combined field observations in the areas noted above, a cross section was developed along the Missouri River, as shown in Figure 6. The geology was simplified into three main units: fill and/or native sandy material, dusky-red siltstone with various amounts of fine sand, and a gray siltstone/shale. Sandstone layers and/or lenses are observed within both the dusky-red siltstone and gray siltstone units. In addition, the geology beneath the intersection between 10th Street NE and North River Road was inferred based on lithology observed at (west to east) MW-11, MW-99 and MW-61S/D. These monitoring wells have a notable absence of the dusky-red unit typically observed along the Missouri River. Thick sequences of fill and/or sandy material was encountered. The notable absence of the dusky-red unit likely represents removal of the dusky-red unit through construction and/or erosional processes. Alternatively, the thick sequence of sandy material observed at MW-61S/D could be related to a steep and narrow channel in-fill.

3. FIELD METHODS

On September 2, 2020, Ramboll geologists conducted a geologic survey of exposed outcrops along the northern bank of the Missouri River in Great Falls, Montana. The location of the investigation area associated with AOC-16 (rock outcrops 1-8) was approximately 500 feet southeast from the Truck Loading Rack Area of CMR operations (see Figure 2). Additional rock outcrops further east of the CMR facility were observed as part of this investigation (rock outcrops 9-15 as shown on Figure 2). The locations of the investigation are denoted on Figure 2, the general geologic description of each rock outcrop is described in Table 3 and photos of the outcrops are shown in the photolog included as Appendix B.

The survey was initiated at the nearest rock outcropping relative to the deep monitoring well (MW-41D) installed during the AOC-16 Interim Measures Design field activities. The field team moved from west to east, following rock outcrops 1-8, to verify the lateral continuity of geological units identified in Table 2. The survey involved identification of geological characteristics (i.e., identification of grain size, color and depositional features) of the exposed outcrops along the Missouri River.

3.1 SOUTHEAST OF AOC-16

The investigation area immediately southeast of AOC-16 (rock outcrops 1-8), shown in Figure 2, are at a similar elevation as the subsurface deposits identified in the AOC-16 Interim Measures Design field activities (see Table 2). The outcrops observed at these rock outcrops were geographically the closest rock outcrops to the deep monitoring well (MW-41D) installed along North River Road. Rock outcrops were observed to be in-situ[1] (rock outcrops 1-4 and 6), float material[2] overlying local deposits (rock outcrops 7 and 8) or beneath the soil horizon and not definitively identifiable as in-situ (rock outcrop 5).

Rock outcrops 1-3 shared similar geologic characteristics and all appeared to be in place. The depositional units were predominately weathered siltstone or mudstone, dusky-red in color, thinly laminated, with varying amounts of fine sand. Mottling was observed at rock outcrops 1 and 3.

Rock outcrops 4-6 outcropped in relatively close proximity to one another and stratigraphically lower than rock outcrops 1-3. Rock outcrops 4-6 were identified as weathered gray to dark gray siltstones and mudstones. Rock outcrops 4 and 6 were both thinly laminated and appeared to be in-situ and rock outcrop 6 presented with yellow mottling. The strata at rock outcrop 4 was visibly saturated and wet (see Appendix B). The observed saturation at this location may be daylighting of groundwater from the upper bedrock semi-confined hydrostratigraphic unit.

Rock outcrop 7 was identified as a strongly lithified, thinly bedded, gray sandstone. This unit was not in-situ, but float material that rested on top of in-situ dusky-red siltstone deposits

[1] In-situ is a large outcrop that has not been disturbed from its original stratigraphic location by faulting or erosional processes.

[2] Float is a piece of rock that has been removed and transported from its original geologic outcrop.

(rock outcrops 1-3). Rock outcrop 8 was a piece of float material that exhibited distinct thin laminations of a dusky-red siltstone and/or mudstone.

3.2 EAST OF AOC-16

Additional rock outcrops were identified further east from the AOC-16 investigation area that were discussed above. These additional outcrops were investigated to gain better understanding regarding the variability of geologic units along the northern bank of the Missouri River (i.e., fifth member of the Kootenai Formation). Descriptions of the rock outcrops and geology are as follows (west to east):

Rock Outcrop 9

Exposed outcrops were observed beneath the 15th Street Bridge. Despite the slight disturbance of the beds that was likely attributed to the construction of the bridge, the units appeared to be relatively in-place and demonstrated contacts between different lithologic units. Contacts of the sedimentary units were observed, as follows (top to bottom):

- A very competent and thinly bedded sandstone overlaid a dusky red and weakly laminated siltstone.
- The contact between the dusky-red siltstone was observed to be a very fine and strongly cemented sandstone.
- The strongly cemented sandstone overlaid a dusky-red siltstone with variable amounts of sand and weak laminations.
- The base of the exposed outcrop section was a gray, mottled siltstone/mudstone.

Rock Outcrop 15

A well exposed outcrop along North River Road was located approximately a quarter mile east of rock outcrop 9 and at slightly higher elevation than the 15th Street Bridge outcrops. Here, a thinly bedded, maroon siltstone which exhibited mottling was observed.

Rock Outcrops 13 and 14

Both outcrops were exposed in close vicinity to each other along the walking trail. Rock outcrop 13 was stratigraphically higher than rock outcrop 14. A thinly bedded maroon siltstone was observed at rock outcrop 13, which was similar to the outcrop observed at rock outcrop 15. The maroon siltstone was immediately above a gray, thinly bedded sandstone at rock outcrop 14.

Rock Outcrop 10

An exposed outcrop of gray, strongly lithified and cross-bedded sandstone was observed on top of Smelter Hill close to Black Eagle Dam. Based on elevation, rock outcrop 10 is the highest (youngest) in-situ stratigraphic unit observed during this investigation.

Rock Outcrop 11

A thinly bedded maroon siltstone with varying amounts of sand is located stratigraphically lower than rock outcrop 10.

Rock Outcrop 12

The small island associated with Black Eagle Dam was predominately composed of rubble and overgrowth; however, near the riverbank, exposed sections of gray, coarsely crystalline outcrop was observed that exhibited orthogonal joint set. This unit appears to be an in-situ crystalline limestone (fourth member of the Kootenai Formation Kk4). This unit was the lowest (oldest) stratigraphic deposit observed during this investigation based on relative outcrop elevations.

4. SUMMARY AND CONCLUSIONS

This geologic investigation focused on observing outcrops along the Missouri River to verify the presence and interpret lateral continuity of lithologic units observed during previous drilling activities. The riverbank deposits provided an opportunity to observe in-situ lithology. As outlined in Table 2, the deposits that underly the AOC-16 Area of the CMR facility were observed to be composed of dusky-red siltstone and interbedded with gray, micaceous sandstones overlying a gray mottled siltstone/shale unit. Rock outcrops southeast of the AOC-16 Area (rock outcrops 1-8) were at relatively similar elevations as the depositional units observed during drilling activities along North River Road. Observations during the outcrop investigation generally correlated to the lithologic units identified in deep boring MW-41D.

Based on the undisturbed nature and similar elevation of the deposits along the northern bank of the Missouri River (rock outcrops 1-8), the units represent laterally continuous sedimentary strata that closely correspond to the fifth member (Kk5) of the Kootenai Formation. Figure 4 shows an interpreted cross-section extended towards the Missouri River. In addition, rock outcrops 9-15 (excluding rock outcrop 12) identified alternating layers of sandstone, siltstone and mudstone (Kk5) that were underlain by a gray, orthogonally jointed crystalline limestone (Kk4) located to the east of Black Eagle Dam (rock outcrop 12).

Rock outcrop 12 likely represents the contact between the fifth (Kk5) and fourth (Kk4) members of the Kootenai Formation. These observations further support that AOC-16 deposits exist entirely within the fifth member (Kk5) of the Kootenai Formation and the geologic contact with the fourth member (Kk4) rests stratigraphically lower than the units observed during field investigations at CMR at an estimated elevation of 3,262 ft amsl. The closest domestic well to CMR is located approximately 1,500 feet northeast of the AOC-16 and is presumably screened in the Sunburst Member of the Kootenai Formation at elevations from 3210 to 3240 ft amsl. Presuming Kootenai Formation is horizontal without any dip[3], Table 4 below summarizes the depth from ground surface at various portions of the CMR site to the projected upper contact of the fourth (Kk4) member and the upper contact of the Sunburst Member (Kks) of the Kootenai Formation.

[3] The Northwest – Southeast trending Sweetgrass Arch, a fracture anticline, is located approximately 1.5 miles Northeast of the AOC-16. The Kootenai Formation maybe inferred to have a Southwesterly dip such that the depth to the upper contact of the Sunburst Member (Kks) of the Kootenai Formation maybe at a deeper depth than indicated in Table 4.

Area	Ground Surface Elevation	Depth to the Projected Upper Contact to the Kk4 (3264 ft amsl)	Depth to the Projected Upper Contact to the Kks (3240 ft amsl)
Active Refinery	3,320 ft to 3,368 ft	58 ft to 106 ft	80 ft to 128 ft
West Rail	3,324 ft to 3,334 ft	62 ft to 72 ft	84 ft to 94 ft
East Rail	3,320 ft to 3,344 ft	58 ft to 82 ft	80 ft to 104 ft
AOC-16	3,337 ft to 3,371 ft	75 ft to 109 ft	97 ft to 131 ft

Table 4: Projected Depths to the Top of the Fourth and Sunburst Members of the Kootenai Formation

The lowest stratigraphic elevation reached during soil borings and/or monitoring wells in the West Rail, East Rail, and AOC-16 areas are WB-14D (3,281 ft), MW-99 (3,302 ft), and MW-41D (3,307 ft), respectively. At the bottom, a gray siltstone/shale was observed at WB-14D and MW-41D, while a well-cemented sandstone unit was observed at MW-99.

4.1 UPDATED CONCEPTUAL SITE MODEL

Based on previous field investigations discussed in Section 2.2, including this geologic outcrop investigation, the updated CSM is discussed below and presented in Figure 7.

4.1.1 Geology

The upper horizon at CMR is composed of fill and/or reworked material consisting of gravels with varying amounts of sands, silts and clays. The reworked material also consists of glaciolacustrine deposits composed of varying amounts of unconsolidated silts and sands that range from loose to hard or dense along with discontinuous lenses and/or beds of sandstone (Figure 7).

Beneath the surface deposits is the fifth member (Kk5) of the lower Cretaceous Kootenai Formation. The fifth member (Kk5) consists of siliciclastic muddy fluvial and fluviolacustrine deposits composed predominantly of interbedded mudstones, siltstone and thin lenses and beds of well cemented very fine to fine cross-bedded sandstone. The uppermost part that is laterally continuous beneath CMR is a dusky-red weathered and weakly laminated siltstone/mudstone deposits. In some cases, sand content is greater in the upper portions of this stratigraphic unit. The lower part of the fifth member of the Kootenai Formation consists of a dark-gray shale.

During this geologic outcrop investigation, an orthogonal jointed limestone was encountered at the lowest stratigraphic location (i.e., rock outcrop 12). This unit likely represents the fourth member (Kk4) of the Kootenai Formation. However, it is unknown whether this upper limestone unit is present beneath the CMR facility. This unit was not mentioned in the

geologic description for the fourth member (Kk4) outlined in the DRAFT OU2 Groundwater Conceptual Site Model for the nearby Anaconda Copper Mining (ACM) Company Smelter and Refinery NPL Site approximately 1 mile east of the CMR facility (Woodard & Curran 2020). The lower portion of the fourth member (Kk4) is a dusky-red sandstone interbedded with very dark reddish-brown mudstone (Burden 1984). Therefore, the distinction between the fifth and fourth members may be difficult if the limestone unit is not present beneath the CMR facility. The limestone observed during this investigation should be distinguished from the underlying much older Paleozoic limestone of the Madison Group which is host to the principal regional aquifer.[4]

4.1.2 Hydrogeology

There are four distinct hydrostratigraphic units that extend across the Site and overlie the regional aquifer (CMR 2020b). The current understanding of the Site's hydro-stratigraphy is as follows:

- The *Perched Unconfined Saturated Zone* is a low yield hydrostratigraphic unit present within fill, glaciolacustrine deposits and/or poorly lithified mudstone/siltstone that contain various amounts of fine sand. The top of competent bedrock is encountered and appears laterally continuous across the site as a dusky-red siltstone. The weathered portion of the dusky-red siltstone is moist and constitutes the base of the Perched Unconfined Saturated Zone. Due to heterogenous nature of re-worked surficial deposits, perched groundwater was observed to be discontinuous. Groundwater elevations in the perched hydrostratigraphic unit shows a rapid response to infiltration of surface water from rain and/or snowmelt.
- The *Upper Aquitard* which hydraulically separates the overlying Perched Unconfined Saturated Zone and the underlying Upper Bedrock Semi-Confined Saturated Zone is comprised of the dry dusky-red siltstone. This unit is composed of a well lithified siltstone/mudstone interbedded with moderately to well cemented sandstone. The Upper Aquitard is continuous across the site except for a few locations where it has been either removed by excavation or erosional processes.[5] The low permeable strata of the aquitard impedes the hydraulic communication between the overlying Perched Unconfined Saturated Zone and the underlying Upper Bedrock Semi-Confined Saturated Zone.
- The *Upper Bedrock Semi-Confined Saturated Zone* is a low yield hydrostratigraphic unit underlying the Upper Aquitard and is composed of alternating layers of hard massive siltstone and/or shales[6] with fine to very fine sandstone lenses and/or beds.

[4] The famous Giant Spring located along the south bank of the Missouri River a few miles east of the site is the location where the underlying (~400 feet bgs) confined Madison Aquifer day lights to the surface under flowing artesian conditions at a remarkable discharge rate of approximately 100,000 gallons per minute (gpm).

[5] The first stratigraphic unit associated with the fifth member (Kk5) of the Kootenai (i.e., dusky-red siltstone) was not observed at three monitoring wells (MW-11, MW-62 and MW-99) likely due to excavation related to the construction of 15th Street Bridge and/or erosional processes. The absence of this unit could provide a more readily available migration pathway for perched unconfined groundwater to the upper bedrock semi-confined saturated zone.

[6] The top of the Upper Bedrock Semi-Confined Saturated Zone is typically observed as a gray siltstone and/or shale.

The heterogenous nature of the Upper Bedrock Semi-Confined Saturated Zone lithology results in discontinuous layers of permeability and limits groundwater movement through more permeable lenses/layers or bedding planes.

- The *Sunburst Sandstone Semi-Confined Aquifer* is the shallowest potable aquifer present in the Great Falls area. The Sunburst Member (Kks) of the Kootenai Formation is unit is a well cemented and well sorted quartz sandstone that features cross bedding and ripple laminations. This is the main hydrostratigraphic unit that is associated with a local water supply and, to a limited extent, is used for domestic purposes in the Great Falls area (Wilke 1983). Two nearby domestic wells to the CMR facility were installed in a gray sandstone unit (see Appendix C). Based on the total well depth, screen interval, and lithologic unit, these wells appear to be installed in the Sunburst Sandstone member. Where present, this aquifer produces 25 gpm (Wilke 1983).
- The *Confined Madison Aquifer* is the principal regional aquifer in Cascade County. Paleozoic limestone associated with the Madison Group is host of the Madison Aquifer that is recharged by precipitation and snowmelt from the Little Belt Mountains. This aquifer is overlain by the Lower Cretaceous Kootenai Formation and Jurassic Morrison and Swift Formations. Based on local well information, the Madison Aquifer is approximately 400 feet below CMR (Appendix C).[7]

Groundwater flow in the perched and upper bedrock hydrostratigraphic units is south towards the Missouri River, located directly down-gradient of the site. Perched groundwater does not have an apparent connection to the adjacent Missouri River as the base of the perched saturated zone daylights to the riverbank above the level of the river. Upper bedrock groundwater may also daylight along the riverbank above the river level and/or may discharge into riverbank sediments below the level of the river.

[7] Upon review of an irrigation well located less than one mile east of CMR (Groundwater Information Center [GWIC] ID is 302544), the Madison Aquifer is approximately 366 to 414 feet below the active refinery assuming horizonal stratigraphic of the Madison Group Limestone. However, due to the Sweetgrass Arch anticline, the estimated depths would likely be greater beneath CMR.

TABLES

Table 1
Stratigraphic Section for the Great Falls Area and CMR Hydrostratigraphy
Calumet Montana Refinery, LLC - Great Falls, Montana

Age		Lithology	Hydro-stratigrahpic unit[1]	Map Unit	Geologic Unit	Subunit	Description
N/A		Silt, Sand, Clay	Vadose Zone	N/A	Fill	---	Fill and/or reworked material at the CMR facility consists of gravels with varying amounts of sands, silts and clays. The material is hetergeneous and non-continuous, but overall grain size fines with depth from some gravels and sands to silts and clays.
Cenozoic	Pleistocene / Holocene	Silt, Sand, Clay	Perched Unconfined	Qgl	Glacial Lake Great Falls Deposits	---	Glacial lake deposits and reworked glacial lake deposits. Grayish-brown, yellowish-brown, and pale orange silt interbedded with very fine-grained sand and clay. Lake deposits are horizontally bedded and may be laminated. Unit also contains grayish-orange, yellowish-brown, and pale orange silt and very fine-grained sand of younger alluvial and colluvial deposits reworked from glacial lake deposits.
Mesozoic	Cretaceous	Mudstone Siltstone	Upper Aquitard / Upper Bedrock Semi-Confined	Kk5	Kootenai Formation	Fifth member	Red weathered mudstone and siltstone that contains lenses and beds of brownish-gray and greenish-gray, cross-bedded, micaceous sandstone, and light gray nodular limestone concretions. Lower part contains a dark-gray shale and lignite beds. Thickness approximately 230 ft.
		Limestone Sandstone Mudstone		Kk4		Fourth member	Upper: Brownish-gray limestone and interbedded shale. Lower: Dusky red to pale reddish-brown-weathering, fine to medium-grained, platy, thin- to medium-bedded sandstone interbedded with very dark reddish-brown mudstone that contains brackish water dinoflagellates. Thickness up to 200 ft.
		Sandstone	Sunburst Sandstone Semi-Confined	Kks		Sunburst Sandstone	Light yellowish-brown, well sorted, well cemented, resistant quartz sandstone with interspersed limonite specks. Sedimentary structures include cross bedding and ripple laminations. Thickness 50 ft.
		Mudstone				Second member[2]	Dark gray mudstone that grades downward into red mudustone. Exposed at Ryan Dam.
		Sandstone				Cutbank Sandstone	Moderately well sorted, coarse- to fine-grained sandstone with interspersed black, dark- and light-gray chert clasts. Incompletely exposed near Ryan and Moroney Dam.
	Jurassic	Mudstone	Lower Aquitard	Jm	Morrison Formation	---	Non-marine, varicolored, greenish-gray interbedded shale and siltstone with minor limestone and sandstone beds
		Sandstone		Jsw	Swift Formation	---	Interbedded light gray to light brown, calcareous quartz sandstone ("ribbon sands") and dark gray marine shale
Paleozoic	Mississipian	Limestone	Confined Madison	Mm	Madison Group	Charles Formation / Mission Canyon Fm / Lodgepole Formation	Light to medium gray, medium to thick bedded, cherty marine limestone

Notes: Not all geologic units shown have been encountered beneath Calumet Montana Refinery (CMR). In addition, some units from the Cenozoic have been excluded for a simplified stratigraphic column and are not indicated to be present at CMR.

1 Section 4.1.2 in the Updated Conceptual Site Model Report discusses the hydrostratigraphic units in more detail.

2 Walker (1974) interpreted the dark gray mudstone at Ryan Dam as the Morrison Formation, but Schwartz (2002) determinted that it is part of the Second member of the Kootenai Formation as mapped in adjacent quads (Vuke, 2000; Vuke and others, 2002).

Table 2
North River Road Area Lithology
Calumet Montana Refining, LLC -Great Falls, Montana

Unit #	Unit	Description	Indication of Hydrocarbons	Moisture	Start Depth (ft bgs)	Unit Thickness (ft)	Hydrostratigraphic Unit
1	Silty Sand	Mottling; roots; medium dense	Odor	Moist	Surface	3.5 - 6	Vadose Zone
2	Sandstone	Thinly bedded	Odor	---	3.5 - 6	2.5 - 3	Perched Unconfined
3	Weakly Laminated Siltstone with Sand	Mottling and/or weakly laminated; dense to very dense; gray color then transitions to dusky-red	Odor/Staining Dissipates with depth	Slightly moist	6 – 8	5 – 6	
4	Strongly Cemented Sandstone	Hard	None	Dry	12 – 14	2 – 4	Upper Aquitard
5	Mudstone/Siltstone	Varies in sand content; varies in color (dusky-red to gray); weakly laminated	None	Dry to slightly moist	16 – 19	1 - 3	
6	Siltstone/Shale	Mottling; medium dense to dense	None	Dry to slightly moist	18 – 23	> 2	Upper Bedrock Semi-Confined

Notes:
ft = feet
bgs = below ground surface

Table 3
Summary of Rock Outcrop Descriptions
Calumet Montana Refinery, LLC - Great Falls, Montana

Location	Geologic Unit	Subunit	Hydrostratigraphic Unit[1]	In-situ / Float	Lithology	Description
1	Kootenai Formation	Fifth member	Perched	In-situ	Siltstone/mudstone	Dusky-red, mottled, thinly-laminated, with various amounts of sand
2		Fifth member	Perched	In-situ	Siltstone/mudstone	Dusky-red, thinly-laminated, with various amounts of sand
3		Fifth member	Upper Aquitard	In-situ	Siltstone/mudstone	Dusky-red, mottled, thinly-laminated, with various amounts of sand
4		Fifth member	Upper Bedrock	In-situ	Siltstone/mudstone	Gray to dark gray, thinly-laminated, wet
5		Fifth member	Upper Bedrock	Unknown	Siltstone/mudstone	Gray to dark gray, beneath soil horizon, moist
6		Fifth member	Upper Bedrock	In-situ	Siltstone/mudstone	Gray to dark gray, yellow mottling, thinly-laminated
7		Fifth member	--	Float	Sandstone	Gray, strongly-lithified, thinly-bedded
8		Fifth member	--	Float	Siltstone/mudstone	Red, thinly-laminated
9*		Fifth member	--	In-situ	Cross-section of various units of siltstone, mudstone, and sandstone	
10		Fifth member	--	In-situ	Sandstone	Gray, strongly-lithified, cross-bedded
11		Fifth member	--	In-situ	Siltstone	Maroon, thinly-bedded, various amounts of fine sand
12		Fourth member	--	In-situ	Crystalline limestone	Gray, coarse-grain, crystalline, jointing
13		Fifth member	--	In-situ	Siltstone	Maroon, thinly-bedded, various amounts of fine sand
14		Fifth member	--	In-situ	Sandstone	Gray, thinly-bedded
15		Fifth member	--	In-situ	Siltstone	Maroon, thinly-laminated, mottled various amounts of fine sand

Notes:

* Rock outcrop exposed beneath 15th Street Bridge had multiple geologic units present.

1 Monitoring well screen intervals are identified as the following: "perched" unconfined wells, "upper bedrock" semi-confined wells, or cross-connected wells. The perched and upper bedrock units are seperated by an shallow aquitard (i.e. a dry dusky-red unit composed primarly of silts and clays). Some monitoring wells and/or piezometers have unknown screen intervals and, therefore, the hydrostratigrahpic unit was listed as unknown.

APPENDIX A
Boring Logs

- MW-11 – screened in both the Perched and Upper Bedrock Saturated Zones
- MW-41D – screened in the Upper Bedrock Semi-Confined Saturated Zone
- MW-61S – screened in the Perched Saturated Zone
- MW-61D – screened in the Perched Saturated Zone
- MW-62 – screened in both the Perched and Upper Bedrock Saturated Zones
- MW-71 – screened in the Perched Saturated Zone
- MW-72 – screened in the Perched Saturated Zone
- MW-7D – screened in the Perched Saturated Zone
- MW-81D – screen in the Upper Bedrock Semi-Confined Saturated Zone
- MW-98 – screened in both the Perched and Upper Bedrock Saturated Zones
- MW-99 – screened in the Perched Unconfined Saturated Zone
- MW-105 – screened in the Perched Saturated Zone
- WB-14D – screened in the Upper Bedrock Semi-Confined Saturated Zone

APPENDIX B
Geology Survey Photolog

LOCATION 1: SILTSTONE/MUDSTONE (IN-SITU)

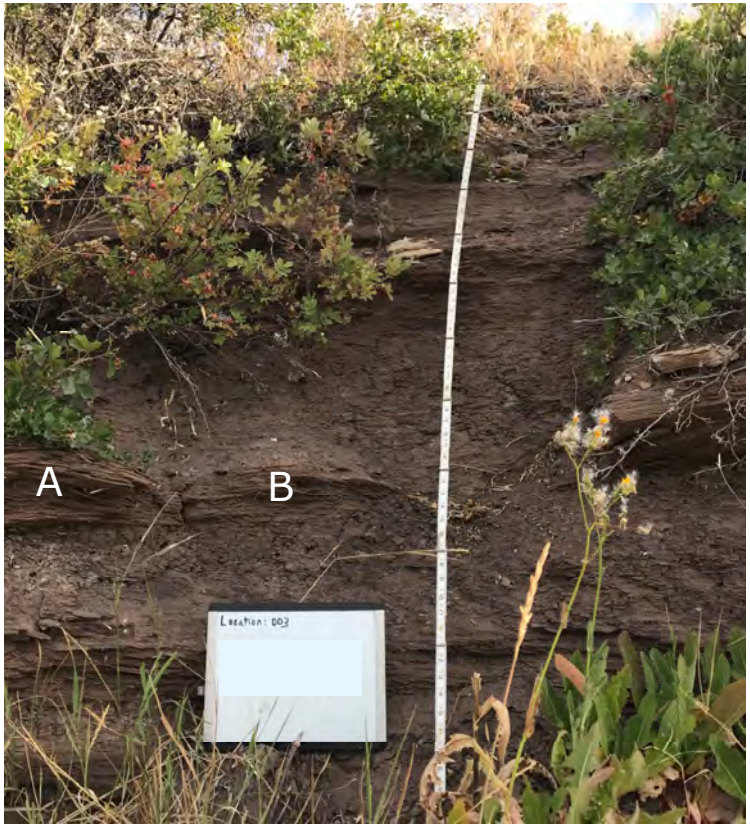
Description: Dusky-red, mottled, thinly-laminated, with various amounts of sand
Geologic Unit: Fifth member of the Kootenai Formation
Hydro-Stratigraphic Unit: Perched Unconfined

LOCATION 2: SILTSTONE/MUDSTONE (IN-SITU)

Description: Dusky-red, thinly-laminated, with various amounts of sand
Geologic Unit: Fifth member of the Kootenai Formation
Hydro-Stratigraphic Unit: Perched Unconfined

LOCATION 3: SILTSTONE/MUDSTONE (IN-SITU)

Description: Dusky-red, mottled, thinly-laminated, with various amounts of sand
Geologic Unit: Fifth member of the Kootenai Formation
Hydro-Stratigraphic Unit: Upper Aquitard



LOCATION 4: SILTSTONE/MUDSTONE (IN-SITU)

Description: Gray to dark gray, thinly-laminated, wet
Geologic Unit: Fifth member of the Kootenai Formation
Hydro-Stratigraphic Unit: Upper Bedrock Semi-Confined

LOCATION 5: SILTSTONE/MUDSTONE

Description: Gray to dark gray, beneath soil horizon, moist
Geologic Unit: Fifth member of the Kootenai Formation
Hydro-Stratigraphic Unit: Upper Bedrock Semi-Confined

LOCATION 6: SILTSTONE/MUDSTONE (IN-SITU)

Description: Gray to dark gray, yellow mottling, thinly-laminated
Geologic Unit: Fifth member of the Kootenai Formation
Hydro-Stratigraphic Unit: Upper Bedrock Semi-Confined

LOCATION 7: SANDSTONE (FLOAT)

Description: Gray, strongly-lithified, thinly-bedded
Geologic Unit: Fifth member of the Kootenai Formation

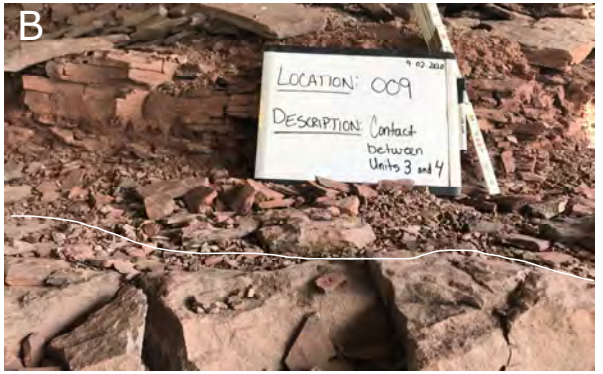
LOCATION 8: SILTSTONE/MUDSTONE (FLOAT)

Description: Red, thinly-laminated
Geologic Unit: Fifth member of the Kootenai Formation

LOCATION 9: CROSS-SECTION BENEATH 15TH STREET BRIDGE

Geologic Unit: Fifth member of the Kootenai Formation

A: Contact between sandstone and siltstone



B: Contact between siltstone and sandstone

C: Contact between sandstone and siltstone

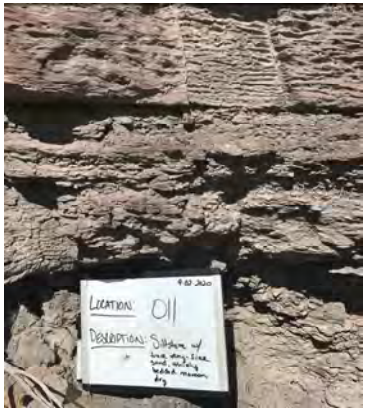
D: Contact between red and gray siltstone/mudstone

LOCATION 10: SANDSTONE (IN-SITU)

Description: Gray, strongly-lithified, cross-bedded
Geologic Unit: Fifth member of the Kootenai Formation

LOCATION 11: SILTSTONE (IN-SITU)

Description: Maroon, thinly-bedded, various amounts of fine sand
Geologic Unit: Fifth member of the Kootenai Formation



LOCATION 12: LIMESTONE (IN-SITU)

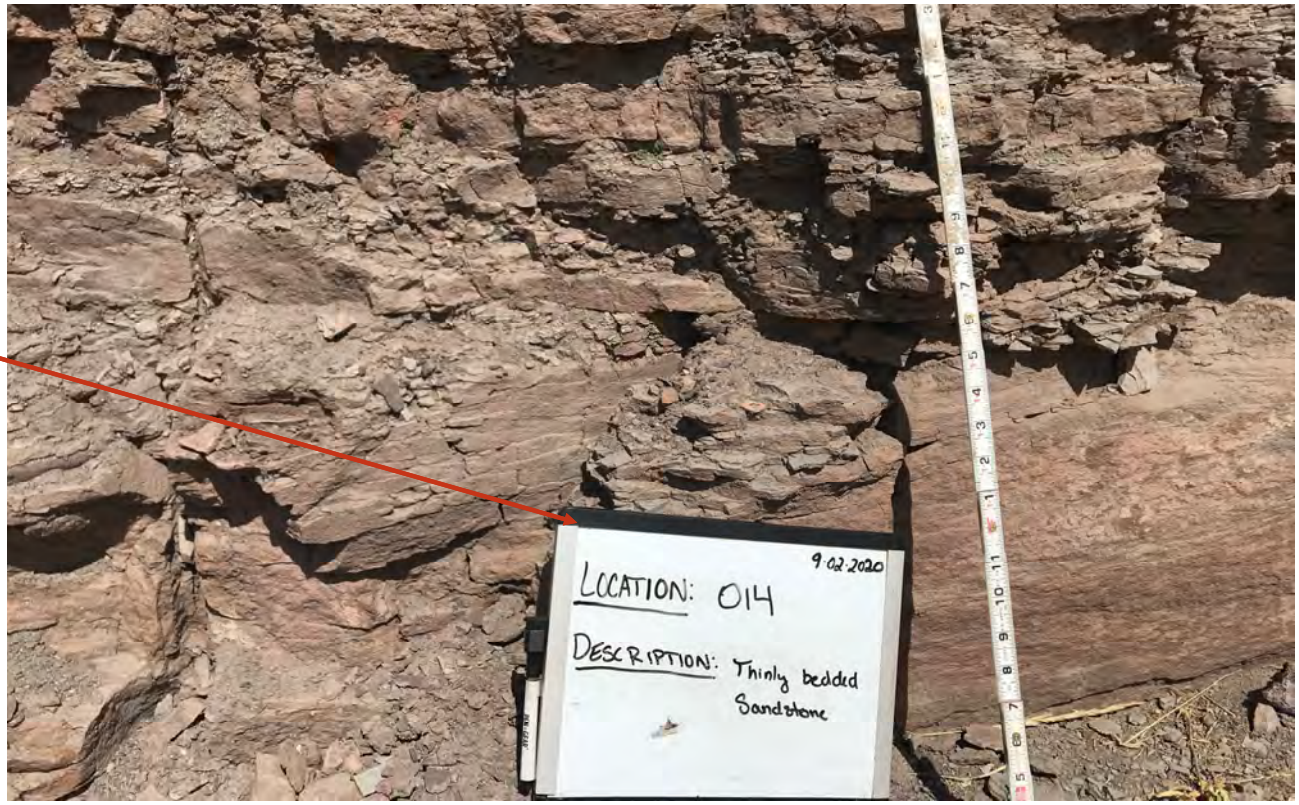
Description: Gray, coarse-grain, crystalline, jointing
Geologic Unit: Fourth member of the Kootenai Formation

LOCATION 13: SILTSTONE (IN-SITU)

Description: Maroon, thinly-bedded, various amounts of fine sand
Geologic Unit: Fifth member of the Kootenai Formation

LOCATION 14: SANDSTONE (IN-SITU)

Description: Gray, thinly-bedded
Geologic Unit: Fifth member of the Kootenai Formation



LOCATION 15: SILTSTONE (IN-SITU)

Description: Maroon, thinly-laminated, mottled, various amounts of fine sand
Geologic Unit: Fifth member of the Kootenai Formation

Notes:

Domestic wells within 1.5 miles of the Calumet Montana Refining facility.
Well information obtained from the Montana Bureau of Mines and Geology (MGMB) Science and Service webpage (https://mbmg.mtech.edu/mapper/mapper.asp?view=Wells&).

GWIC ID = Ground Water Information Center Identification
Fm. = Formation
ft = feet
ft-amsl = feet above mean sea level
gpm = gallons per minute
[1] Ground surface elevation estimated using Google Earth
[2] During the well test the discharge rate shall be as uniform as possible. This rate may or may not be the sustainable yield of the well. Sustainable yield does not include the reservoir of the well casing.
[3] It is possible the well screen interval is located in the basal Sunburst member (i.e., Sunburst Sandstone Aquifer) of the Kootenai Formation based on total depth, screen interval, and lithologic unit the well was installed.

Table C-2
Geologic Unit Description
Calumet Montana Refinery, LLC - Great Falls, Montana

GWIC ID: 268738				
Top of Unit (ft)	**Top of Unit (ft-amsl)**	**Bottom of Unit (ft)**	**Bottom of Unit (ft-amsl)**	**Unit Description**
0	3408	5	3403	Gravel
5	3403	8	3400	Red Shale
8	3400	68	3340	Gray and Green Shale
68	3340	114	3294	Red Mudstone
114	3294	125	3283	Hard Gray Shale
125	3283	210	3198	Light Gray Siltstone
210	3198	248	3160	Gray Sandstone[1]
248	3160	270	3138	Dark Gray Shale

Notes:

GWIC ID = Ground Water Information Center Identification

ft = feet

ft-amsl = feet above mean sea level

[1] Based on the total well depth, screen interval, and lithologic unit, this well appears to be installed in the Sunburst Sandstone member.

Table C-3
Geologic Unit Description
Calumet Montana Refinery, LLC - Great Falls, Montana

GWIC ID: 224908				
Top of Unit (ft)	**Top of Unit (ft-amsl)**	**Bottom of Unit (ft)**	**Bottom of Unit (ft-amsl)**	**Unit Description**
0	3420	6	3414	Topsoil
6	3414	10	3410	Sand

102	3354	110	3346	Red Shale
110	3346	150	3306	Clay Hardpan
150	3306	161	3295	White Sandstone and Water[1]

Notes:

GWIC ID = Ground Water Information Center Identification
ft = feet
ft-amsl = feet above mean sea level
[1] Based on the total well depth, screen interval, and lithologic unit, it is uncertain whether this well was installed in the Sunburst Sandstone member.

Table C-5
Geologic Unit Description
Calumet Montana Refinery, LLC - Great Falls, Montana

GWIC ID: 302544				
Top of Unit (ft)	**Top of Unit (ft-amsl)**	**Bottom of Unit (ft)**	**Bottom of Unit (ft-amsl)**	**Unit Description**
0	3405	6	3399	Brown Sand

300	3105	310	3095	Gray Shale
310	3095	320	3085	Gray Sandstone
320	3085	365	3040	Gray Shale
365	3040	380	3025	Gray Sandstone
380	3025	415	2990	Gray Shale
415	2990	440	2965	Gray Shale and Sandstone
440	2965	451	2954	Gray Shale
451	2954	527	2878	White and Tan Limestone

Notes:

GWIC ID = Ground Water Information Center Identification
ft = feet
ft-amsl = feet above mean sea level
[1] Based on the elevation, unit thickness, and lithological unit, this sandstone likely represents the Sunburst Sandstone member.

Table C-6
Geologic Unit Description

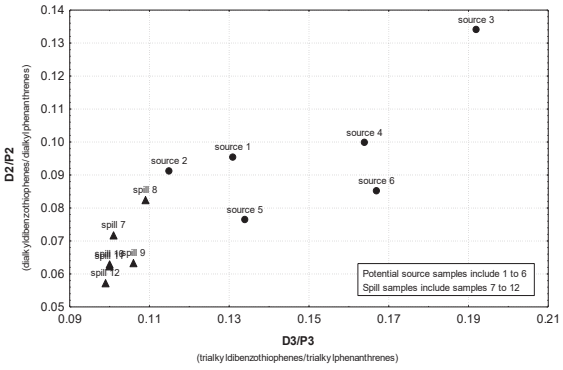
MW-70 LNAPL FINGERPRINTING ANALYTICAL RESULTS

Environmental Forensic Report

Figure 1. Double Ratio Plot



MW-70

SDG: F170012

Report To:

Calumet Montana Refining, LLC
1900 10th St. NE
Great Falls, MT 59404

Report By:

META Environmental, Inc.
1000 Turk Hill Road
Fairport, NY 14450

August 29, 2017

Identifying and allocating sources of pollutants in complex environments.

META

Executive Summary

One NAPL sample from the Calumet Montana Refining site (MW-70) was analyzed for hydrocarbon fingerprint and an expanded list of monocyclic aromatic hydrocarbons (MAHs), including benzene, toluene, ethylbenzene, and xylenes, polycyclic aromatic hydrocarbons (PAHs), and saturated hydrocarbons.

Sample MW-70 was a mixture of No. 2 fuel oil or diesel fuel and gasoline (or similar product).

Sample RW HC 7-27-17 was compared to one NAPL sample collected from the site in April 2017, 3 NAPL samples collected from the site in September and October of 2016, a sediment sample collected from the site in May 2017, and a NAPL sample collected from the site in July 2017.

Based on a qualitative review of the fingerprints, sesquiterpane biomarker patterns, and tetraethyl lead content, the material in sample MW-70 was similar to MW-41 and MW-53.

Table of Contents

Introduction

One NAPL sample was received by ESS Laboratory of Cranston RI for META on 8/09/2017. The NAPL was analyzed for hydrocarbon fingerprint, an expanded list of MAHs and PAHs, and saturated hydrocarbons.

This report summarizes the findings and compares the samples.

Sample Delivery Group

Project:	MW-70
Client	Calumet Montana Refining, LLC 1900 10th St. NE Great Falls, MT 59404
Report Contact:	Maurice Frey
Dates of Receipt:	8/09/2017
META Project Number:	C32001
SDG No.:	F170012

Chain of Custody

Chain of custody documentation is included in the ESS Laboratory Report (Appendix D).

Methods

One NAPL sample was prepared in duplicate by solvent dilution (EPA 3580) using dichloromethane (DCM). The extracts were spiked with internal standard and analyzed by GC/FID (EPA 8015M) for fingerprinting, alkanes, and total petroleum hydrocarbons and by GC/MS/SIM (EPA 8270M) for MAHs and PAHs, alkyl PAH homologues and other selected compounds.

Results

Sample results are presented in several appendices which follow this narrative.

Appendix A: GC/FID Fingerprints
Appendix B: Extended MAH/PAH Profiles – Bar Graphs
Appendix C: Extracted Ion Current Profiles (EICPs)
Appendix D: ESS Laboratory Report

Quality Control

The quality control measures, criteria, and results are provided in the ESS laboratory report.

Discussion

Background

Crude petroleum, many of its refined products (e.g., kerosene, diesel fuel, motor oil), coal, coal

tar, and many coal tar products consist primarily of hydrocarbons – chemicals made up of carbon and hydrogen. There are several types of hydrocarbons that are commonly grouped by similar chemical structures, such as alkanes, cyclic alkanes, and aromatic hydrocarbons. MAHs and PAHs are one group of hydrocarbons that are present at high relative amounts in crude oil, coal, coal tar, and many of their products. In environmental forensic chemistry and geochemistry, MAHs and PAHs are placed in subgroups according to their origins. These groups include diagenic, or recently produced; petrogenic, produced at relatively low temperatures over long periods of time; and pyrogenic, produced at high temperatures with a shortage of oxygen. Petrogenic MAHs and PAHs are those found in crude oil, refined petroleum products, and coal. Pyrogenic MAHs and PAHs are those found in coal tar and related substances, and from the incomplete combustion of organic matter (PICs) such as in fires and engines.

PAHs commonly form the basis for source identification at sites involving petrogenic or pyrogenic materials. Studies have shown that the pattern of PAHs clearly distinguishes petrogenic from pyrogenic substances and can be used to identify and classify petrogenic or pyrogenic substances of different origins. For example, ASTM Method D 5739-06 is the method used extensively by the U.S. Coast Guard to determine the source of oil spilled in public waterways. That method relies on the determination of selected PAHs and alkylated PAHs in oil, soil, or water samples by gas chromatography with mass spectrometric detection (GC/MS) and the use of the qualitative patterns and quantitative ratios of those PAHs to determine which oil samples have a common origin. Similarly, work by META Environmental, Inc. (META) has shown that the same methodology can be used to identify the sources of pyrogenic PAHs at foundries, coke plants, tar refineries, wood treating facilities, former manufactured gas plants, and in urban background (among others).

Sample-Specific Observations

MW-70

Sample MW-70 contained petrogenic material (see Definitions). The petrogenic material was indicated by a broad, unresolved complex mixture (UCM) of hydrocarbons that extended from about 14 minutes (decane; n-C10) to about 40 minutes (tetracosane; n-C24) in the GC/FID chromatogram (Appendix A). Normal alkanes, alkylcyclohexanes, and sesquiterpanes, and other hydrocarbons were visible in the GC/MS extracted ion profiles (Appendix C); but not tri- and tetraterpanes and steranes. These characteristics are consistent with heavy distillate fuel oils including No. 2 fuel oil and diesel fuel.

Sample MW-70 also contained normal alkanes, alkylcyclohexanes, and alkylated benzenes from about 5 minutes (hexane; n-C6) to about 14 minutes (n-C10) in addition to the diesel range hydrocarbons. The distribution of normal alkanes, alkylcyclohexanes, and alkylated benzenes in the lower boiling range was characteristic of gasoline.

Tetraethyl lead, a gasoline additive, was qualitatively detected in the GC/MS data.

No other petroleum products or other materials were evident in the data.

The laboratory duplicate analysis of RW HC 7-27-17 was similar.

Relative Amounts of Gasoline and No.2 Fuel Oil

The ranges of gasoline and No. 2 fuel oil (diesel) overlap; therefore, it is not possible to determine the relative amounts of each in a single sample exactly. However, assuming that all mass that elutes before undecane (n-C11) is gasoline, and all mass that elutes after undecane is

diesel, then about 40% of the mass was gasoline and 60% of the mass was No. 2 fuel oil (diesel).

Comparison of MW-70 to Samples Previously Analyzed from the Site

Sample MW-70 was compared to one NAPL sample collected from the site in April 2017, 3 NAPL samples collected from the site in September and October of 2016, a sediment sample collected from the site in May 2017, and a NAPL sample collected from the site in July 2017.

Sample Tank 201 was a crude oil reference sample provided by Calumet Refining. Samples MW-41 and MW-53 were gasoline/distillate mixtures. Sample C-32 LNAPL was No. 2 fuel oil or diesel fuel, and Sample RW HC 7-27-17 was weathered No. 2 fuel oil or diesel. The identity of sample SED-08 (4'-6') was uncertain, but appeared to be severely weathered crude oil.

Based on a qualitative review of the biomarker patterns (Appendix C), the diesel-range material in sample MW-70 was No. 2 fuel oil/diesel similar to C-32 LNAPL. The sesquiterpane biomarker ratio analysis (Figure 1) suggests that the oil in MW-70 and in C-32 LNAPL was the same.

Samples MW-70, MW-41, and MW-53 were all gasoline/diesel mixtures. All three samples contained tetraethyl lead; indicating that at least a portion of the gasoline was an historic variant. It was not possible to determine if the gasoline components of the three samples were same with the available data and because of interferences in the chemical distributions from the diesel-range component.

Qualifications

The interpretation and conclusions in this report are based on the analysis of 1 NAPL sample by GC/FID (EPA Method 8015mod) and GC/MS (EPA Method 8270mod). Systematic or random biases or errors in the data could affect the interpretations; and the conclusions could change with additional data.

Definitions

The following terms and definitions are used throughout this report for consistency and clarity.

Pyrogenic PAHs are generated at relatively high temperature in the absence of oxygen. This includes coal tar, oil tar, their refined products, and the products of incomplete combustion.

Petrogenic PAHs are generated at relatively low temperatures and high pressures over many years. This includes petroleum, refined petroleum products, and coal.

Oil is a mixture of hydrocarbons consisting of crude oil or refined crude oil products such as No.2 fuel oil, No. 6 fuel oil and various lubricating, insulating, and hydraulic oils. Oils are usually less dense than water.

LPAHs and HPAHs refer to low molecular weight PAHs (i.e., 2- and 3-ring PAHs) and high molecular weight PAHs (i.e., 4-, 5-, and 6-ring PAHs).

Background is site-specific and is typically a mixture of pyrogenic HPAHs and weathered petroleum products.

PAH16 is the sum of the 16 U.S. EPA priority pollutant PAHs.

UCM – unresolved complex mixture: a feature frequently observed in gas chromatographic (GC) data of crude oils and refined petroleum products. The reason for the UCM (or hump in the baseline) appearance is that GC cannot resolve a significant portion of the hundreds of hydrocarbon compounds in the sample. The resolved components appear as peaks while the UCM appears as a Gaussian-shaped hump or irregularly-shaped background in the chromatogram.

PICs – products of incomplete combustion. In the context of hydrocarbon forensics, PICs are mostly aromatic compounds, pyrogenically produced.

ESS Laboratory Work Order Number: F170012

This signed Certificate of Analysis is our approved release of your analytical results. These results are only representative of sample aliquots received at the laboratory. ESS Laboratory expects its clients to follow all regulatory sampling guidelines. Beginning with this page, the entire report has been paginated. This report should not be copied except in full without the approval of the laboratory. Samples will be disposed of thirty days after the final report has been delivered. If you have any questions or concerns, please feel free to call our Customer Service Department.

Laboratory Director

REVIEWED
By ESS Laboratory at 1:48 pm, Aug 25, 2017

Analytical Summary
The project as described above has been analyzed in accordance with the ESS Quality Assurance Plan. This plan utilizes the following methodologies: US EPA SW-846, US EPA Methods for Chemical Analysis of Water and Wastes per 40 CFR Part 136, APHA Standard Methods for the Examination of Water and Wastewater, American Society for Testing and Materials (ASTM), and other recognized methodologies. The analyses with these noted observations are in conformance to the Quality Assurance Plan. In chromatographic analysis, manual integration is frequently used instead of automated integration because it produces more accurate results.

The test results present in this report are in compliance with TNI and relative state standards, and/or client Quality Assurance Project Plans (QAPP). The laboratory has reviewed the following: Sample Preservations, Hold Times, Initial Calibrations, Continuing Calibrations, Method Blanks, Blank Spikes, Blank Spike Duplicates, Duplicates, Matrix Spikes, Matrix Spike Duplicates, Surrogates and Internal Standards. Any results which were found to be outside of the recommended ranges stated in our SOPs will be noted in the Project Narrative.

Notes and Definitions

U	Analyte included in the analysis, but not detected
SM	Surrogate recovery(ies) outside of criteria due to matrix (UCM/coelution/matrix is present) (SM).
J	Reported between MDL and MRL
D	Diluted.
ND	Analyte NOT DETECTED at or above the MRL (LOQ), LOD for DoD Reports, MDL for J-Flagged Analytes
dry	Sample results reported on a dry weight basis
RPD	Relative Percent Difference
MDL	Method Detection Limit
MRL	Method Reporting Limit
LOD	Limit of Detection
LOQ	Limit of Quantitation
DL	Detection Limit
I/V	Initial Volume
F/V	Final Volume
§	Subcontracted analysis; see attached report
1	Range result excludes concentrations of surrogates and/or internal standards eluting in that range.
2	Range result excludes concentrations of target analytes eluting in that range.
3	Range result excludes the concentration of the C9-C10 aromatic range.
Avg	Results reported as a mathematical average.
NR	No Recovery
[CALC]	Calculated Analyte
SUB	Subcontracted analysis; see attached report
RL	Reporting Limit
EDL	Estimated Detection Limit

Data Usability Assessment
Methods 8260C, 8270, 6020A, MT EPH/VPH
SDG UF21102, 3 Groundwater Samples, 1 Water Sample

Data validation and usability assessment was conducted for data package UF21102 based on the National Functional Guidelines for Superfund Organic Methods Data Review OSWER 9355.0-132, EPA-540-R-014-002 (USEPA August 2014) and National Functional Guidelines for Superfund Inorganic Methods Data Review (USEPA August 2014). The following samples were reported in this data package:

Sample ID	Lab Sample ID
CMR-WB13D-190619	UF21102-001
CMR-WB12-190619	UF21102-002
CMR-WB11D-190619	UF21102-003
TB-18-20190619	UF21102-004

Data validation included a review of the following QC parameters:

- Data Package Completeness
- Preservation and Holding Times
- Instrument Performance Check
- Blanks
- Deuterated Monitoring Compound or Surrogate Spikes
- Matrix Spike/Matrix Spike Duplicate
- Field Duplicate Samples
- Laboratory Control Sample
- Internal Standards
- Tentatively Identified Compounds
- System Performance
- Overall Assessment of Data

QC criteria were met for each parameter with the following exceptions:

LCS/LCSD Recoveries
During analysis LCS/LCSD samples were run and recoveries were reported. These recoveries were largely in criteria with the exception of aqueous methyl acetate. The out of criteria recoveries indicate a possible bias. Low recoveries indicate a possible low bias and high recoveries indicate a possible high bias. In general, high bias does not affect non-detect results. Based on the potential bias all methyl acetate results have been validated as estimated.

Blank Detections
During analysis, zinc and bis(2-ethylhexyl)phthalate was detected in method blank samples. This indicates a possible cross-contamination issue. Due to this, all low level detections should be evaluated for possible contamination bias. All zinc and bis(2-ethylhexyl)phthalate results below the RL or below 5x the blank result have been validated as non-detect (U).

Overall Assessment of Data
Overall, data are acceptable and usable for project objectives. The laboratory flags (*, F1) to denote out of criteria results were removed. Several results were flagged J by the laboratory because the concentrations calculated were below the method reporting limit and above the laboratory detection limit. The J flag was retained. These results should be considered estimated as the calculated concentrations are below the instrument calibration range.

No additional validation actions were taken on project samples. Results are usable for project purposes as validated.

Attachment 1: Data Validation Summary Checklist

Inorganic Data Review Summary

SDG No. UF21102

Site Calumet Montana Refining

Laboratory Shealy Environmental

Number of Samples/Matrix 3 GW, 1 Water

Reviewer Name R Huening

Completion Date July 16, 2019

Review Criteria	Metals (Modified Skinner List)
Preservation and Holding Times	No issues
Blanks	Zinc detected below the RL in aqueous method blank sample. Project sample detections of zinc below the RL or within 5x the blank result validated as non-detect (U).
Matrix Spike/Matrix Spike Duplicate	No MS?MSD results reported with samples. No action taken.
Laboratory Control Sample	No issues
Duplicate Samples	No issues
Other Non-conformances	No other non-conformances noted during analysis.
Overall Assessment of Data	Project sample detections of zinc below the RL or within 5x the blank result validated as non-detect (U).

SDG No. UF21102

Site Calumet Montana Refining

Laboratory Shealy Environmental

Number of Samples/Matrix 3 GW, 1 Water

Reviewer Name R Huening

Completion Date July 16, 2019

Review Criteria	VOC 8260C, SVOC 8270	VPH/EPH
Preservation and Holding Times	No issues	No issues
Blanks	Two VOCs detected in method blank with no project detections. SVOC bis(2-ethylhexyl)phthalate detected in method blank. All bis(2-ethylhexyl)phthalate project sample detections validated as non-detect (U).	No issues
Deuterated Monitoring Compound or Surrogate Spikes	No issues	Surrogates out due to matrix interference. No action taken.
Matrix Spike/Matrix Spike Duplicate	No MS/MSD results reported with samples. No action taken.	No MS/MSD results reported with samples. No action taken.
Laboratory Control Sample	LCS out of criteria low for methyl acetate. All aqueous methyl acetate results validated as estimated (J, UJ).	No issues
Internal Standards	No issues	No issues
Tentatively Identified Compounds	No TICs identified by the lab.	N/a
Other Non-conformances	No other non-conformances noted.	CCV out of criteria for some compounds due to matrix interference. No action taken.
Overall Assessment of Data	All aqueous methyl acetate and results validated as estimated (J, UJ). All bis(2-ethylhexyl)phthalate project sample detections validated as non-detect (U).	No validation action warranted.

SHEALY ENVIRONMENTAL SERVICES, INC.

Report of Analysis

Ramboll US Corporation

Case Narrative
Ramboll US Corporation
Lot Number: UF21102

This Report of Analysis contains the analytical result(s) for the sample(s) listed on the Sample Summary following this Case Narrative. The sample receiving date is documented in the header information associated with each sample.

All results listed in this report relate only to the samples that are contained within this report.

Sample receipt, sample analysis, and data review have been performed in accordance with the most current approved NELAC standards, the Shealy Environmental Services, Inc. ("Shealy") Quality Assurance Management Plan (QAMP), standard operating procedures (SOPs), and Shealy policies. Any exceptions to the NELAC standards, the QAMP, SOPs or policies are qualified on the results page or discussed below.

If you have any questions regarding this report please contact the Shealy Project Manager listed on the cover page.

Volatiles
The method blank associated with batch 21394 had 1,2,3-trichlorobenzene and 1,2,4-trichlorobenzene detected at a concentration that was below the LOQ. There were no detections for these compounds in the samples associated with this method blank.

The LCS associated with batch 21394 had methyl acetate recovered marginally outside of the acceptance limits. Due to the large number of analytes in the LCS, there is a high statistical probability of a few analytes outside of control limits. Per SW-846 Update V 8000D- 23 Revision 4 July 2014, a number of analytes should be allowed to marginally fail the limits without requirement for corrective action. The laboratory's SOP allows for 10% of analytes to recover marginally outside criteria.

Semivolatiles
The method blank associated with batch 20650 had bis(2-ethylhexyl)phthalate detected at a concentration that was below the LOQ. All samples associated with this method blank that have detections for bis(2-ethylhexyl)phthalate have been flagged with a "B" qualifier.

Montana EPH
Samples -001 and -003 had surrogates recovered outside of the acceptance limits due to confirmed matrix interference.

Montana VPH
The closing continuing calibration verification (CCV) associated with samples -001, -002, and -003 had compounds recovered outside of the acceptance limits due to objective evidence of matrix interference.

Metals
The method blank associated with batch 20830 had zinc detected at a concentration that was below the LOQ. All samples associated with this method blank that have detections for zinc have been flagged with a "B" qualifier.

MEMO

Date: **July 22, 2019**

To: **File**

From: **Rob Huening, Ramboll**

cc: **Daniel J Price, Ramboll**

Subject: **Calumet Montana Refining**
Data Usability Assessment
Methods 8260C, 8270, 6020A, MT EPH/VPH
SDG UF21103, 3 Groundwater Samples, 1 Water Sample

Data validation and usability assessment was conducted for data package UF21103 based on the National Functional Guidelines for Superfund Organic Methods Data Review OSWER 9355.0-132, EPA-540-R-014-002 (USEPA August 2014) and National Functional Guidelines for Superfund Inorganic Methods Data Review (USEPA August 2014). The following samples were reported in this data package:

Sample ID	Lab Sample ID
CMR-WB13S-190620	UF21103-001
CMR-WB05S-190620	UF21103-002
CMR-WB104S-190620	UF21103-003
TB-20-20190620	UF21103-004

Data validation included a review of the following QC parameters:

- Data Package Completeness
- Preservation and Holding Times
- Instrument Performance Check
- Blanks
- Deuterated Monitoring Compound or Surrogate Spikes
- Matrix Spike/Matrix Spike Duplicate
- Field Duplicate Samples
- Laboratory Control Sample
- Internal Standards
- Tentatively Identified Compounds
- System Performance
- Overall Assessment of Data

QC criteria were met for each parameter with the following exceptions:

LCS/LCSD Recoveries
During analysis LCS/LCSD samples were run and recoveries were reported. These recoveries were largely in criteria with the exception of methyl acetate and acetone. The out of criteria recoveries indicate a possible bias. Low recoveries indicate a possible low bias and high recoveries indicate a possible high bias. In general, high bias does not affect non-detect results. Based on the potential bias all methyl acetate and acetone results have been validated as estimated.

Blank Detections
During analysis, bis(2-ethylhexyl)phthalate was detected in method blank samples. This indicates a possible cross-contamination issue. Due to this, all low level detections should be evaluated for possible contamination bias. All bis(2-ethylhexyl)phthalate results below the RL or below 5x the blank result have been validated as non-detect (U).

Sample Receipt Issues
The lab reported in the narrative that some samples arrived at the lab with pH values out of criteria. The lab adjusted the pH upon receipt and continued analysis as normal. No additional validation was warranted.

Hold Time
All samples were analyzed by the lab within their hold time requirements. However, due to QC issues during the initial analysis some samples were reanalyzed outside of hold time. While these out of hold time results are generally usable, the results within hold time should be used preferentially.

Overall Assessment of Data
Overall, data are acceptable and usable for project objectives. The laboratory flags (*, F1) to denote out of criteria results were removed. Several results were flagged J by the laboratory because the concentrations calculated were below the method reporting limit and above the laboratory detection limit. The J flag was retained. These results should be considered estimated as the calculated concentrations are below the instrument calibration range.

No additional validation actions were taken on project samples. Results are usable for project purposes as validated.

Inorganic Data Review Summary

SDG No. UF21103

Site Calumet Montana Refining

Laboratory Shealy Environmental

Number of Samples/Matrix 3 GW, 1 Water

Reviewer Name R Huening

Completion Date July 16, 2019

Review Criteria	Metals (Modified Skinner List)
Preservation and Holding Times	No issues
Blanks	Zinc detected below the RL in aqueous method blank sample. Project sample detections of zinc well above blank result. No action taken.
Matrix Spike/Matrix Spike Duplicate	No MS/MSD results reported with samples. No action taken.
Laboratory Control Sample	No issues
Duplicate Samples	No issues
Other Non-conformances	No other non-conformances noted during analysis.
Overall Assessment of Data	No validation action warranted.

SDG No. UF21103

Site Calumet Montana Refining

Laboratory Shealy Environmental

Number of Samples/Matrix 3 GW, 1 Water

Reviewer Name R Huening

Completion Date July 16, 2019

Review Criteria	VOC 8260C, SVOC 8270	VPH/EPH
Preservation and Holding Times	Several VOC samples rerun out of hold time due to LCS issues. Results within hold time should be used preferentially. One SVOC sample received with pH greater than 2. pH adjusted at the lab, no action taken.	No issues
Blanks	SVOC bis(2-ethylhexyl)phthalate detected in method blank. All bis(2-ethylhexyl)phthalate project sample detections validated as non-detect (U).	No issues
Deuterated Monitoring Compound or Surrogate Spikes	No issues	Surrogates out due to matrix interference. No action taken.
Matrix Spike/Matrix Spike Duplicate	No MS/MSD results reported with samples. No action taken.	No MS/MSD results reported with samples. No action taken.
Laboratory Control Sample	LCS out of criteria high for acetone and low for methyl acetate. All aqueous methyl acetate results validated as estimated (J, UJ) and all detected results for acetone validated as estimated (J).	No issues
Internal Standards	No issues	No issues
Tentatively Identified Compounds	No TICs identified by the lab.	N/a
Other Non-conformances	No other non-conformances noted.	CCV out of criteria for some compounds due to matrix interference. No action taken.
Overall Assessment of Data	All aqueous methyl acetate results validated as estimated (J, UJ) and all detected results for acetone validated as estimated (J). All bis(2-ethylhexyl)phthalate project sample detections validated as non-detect (U).	No validation action warranted.

Case Narrative
Ramboll US Corporation
Lot Number: UF21103

This Report of Analysis contains the analytical result(s) for the sample(s) listed on the Sample Summary following this Case Narrative. The sample receiving date is documented in the header information associated with each sample.

All results listed in this report relate only to the samples that are contained within this report.

Sample receipt, sample analysis, and data review have been performed in accordance with the most current approved NELAC standards, the Shealy Environmental Services, Inc. ("Shealy") Quality Assurance Management Plan (QAMP), standard operating procedures (SOPs), and Shealy policies. Any exceptions to the NELAC standards, the QAMP, SOPs or policies are qualified on the results page or discussed below.

If you have any questions regarding this report please contact the Shealy Project Manager listed on the cover page.

Volatiles
The laboratory control sample (LCS) associated with batch 21545 had acetone recovered above the acceptance limits. This could potentially result in a high bias on analytical results. Samples -001, -002, and -003 were re-analyzed outside of the holding time for confirmation. Both sets of data are reported.

The LCS associated with batch 21545 had methyl acetate recovered marginally outside of the acceptance limits. Due to the large number of analytes in the LCS, there is a high statistical probability of a few analytes outside of control limits. Per SW-846 Update V 8000D- 23 Revision 4 July 2014, a number of analytes should be allowed to marginally fail the limits without requirement for corrective action. The laboratory's SOP allows for 10% of analytes to recover marginally outside criteria.

Semivolatiles
The method blank associated with batch 20650 had bis(2-ethylhexyl)phthalate detected at a concentration that was below the LOQ. All samples associated with this method blank that have detections for bis(2-ethylhexyl)phthalate have been flagged with a “B” qualifier.

Sample -003 was diluted 5X due to the sample matrix. The reporting limits have been raised accordingly.

Sample -003 was not preserved to a pH<2, although samples were received in the correct sample containers and preservative.

Montana VPH
Sample -003 had MTBE and naphthalene detected in the VPH analysis and confirmed via dual detector analysis (FID/PID). However, additional compounds elute at approximately the same times as naphthalene and MTBE, making it difficult for analysts to distinguish the target compounds from non-target compounds. Second method confirmation was performed via GC/MS analysis. The results via dual detection (FID/PID) were not compared to or adjusted based on results via 8260B GC/MS.

The closing continuing calibration verification (CCV) associated with samples -001, -002, and -003 was recovered outside of the acceptance limits due to objective evidence of matrix interference.

Metals

The method blank associated with batch 20830 had zinc detected at a concentration that was below the LOQ. All samples associated with this method blank that have detections for zinc have been flagged with a “B” qualifier.

MEMO

Date: **July 22, 2019**

To: **File**

From: **Rob Huening, Ramboll**

cc: **Daniel J Price, Ramboll**

Subject: **Calumet Montana Refining**
Data Usability Assessment
Methods 8260C, 8270, 6020A, MT EPH/VPH
SDG UF22026, 2 Groundwater Samples, 1 Water Sample

Data validation and usability assessment was conducted for data package UF22026 based on the National Functional Guidelines for Superfund Organic Methods Data Review OSWER 9355.0-132, EPA-540-R-014-002 (USEPA August 2014) and National Functional Guidelines for Superfund Inorganic Methods Data Review (USEPA August 2014). The following samples were reported in this data package:

Sample ID	Lab Sample ID
CMR-WB11S-190621	UF22026-001
CMR-WB10-190621	UF22026-002
TB-20-20190621	UF22026-003

Data validation included a review of the following QC parameters:

- Data Package Completeness
- Preservation and Holding Times
- Instrument Performance Check
- Blanks
- Deuterated Monitoring Compound or Surrogate Spikes
- Matrix Spike/Matrix Spike Duplicate
- Field Duplicate Samples
- Laboratory Control Sample
- Internal Standards
- Tentatively Identified Compounds
- System Performance
- Overall Assessment of Data

QC criteria were met for each parameter with the following exceptions:

Surrogates/Internal Standards
Surrogates and/or internal standards were out of criteria for several samples analyzes. Surrogates out of criteria can indicate a possible accuracy bias. However, according to the lab narrative the recovery issues were likely due to sample dilutions or matrix effects. Therefore no results have been validated.

LCS/LCSD Recoveries
During analysis LCS/LCSD samples were run and recoveries were reported. These recoveries were largely in criteria with the exception of methyl acetate. The out of criteria recoveries indicate a possible bias. Low recoveries indicate a possible low bias and high recoveries indicate a possible high bias. In general, high bias does not affect non-detect results. Based on the potential bias all methyl acetate results have been validated as estimated.

Blank Detections
During analysis, acetone and bis(2-ethylhexyl)phthalate were detected in method and trip blank samples (respectively). This indicates a possible cross-contamination issue. Due to this, all low level detections should be evaluated for possible contamination bias. All acetone and bis(2-ethylhexyl)phthalate results below the RL or below 5x the blank result have been validated as non-detect (U).

Sample Receipt Issues
The lab reported in the narrative that some samples arrived at the lab with pH values out of criteria. The lab adjusted the pH upon receipt and continued analysis as normal. No additional validation was warranted.

Hold Time
All samples were analyzed by the lab within their hold time requirements. However, due to QC issues during the initial analysis some samples were reanalyzed outside of hold time. While these out of hold time results are generally usable, the results within hold time should be used preferentially.

Overall Assessment of Data
Overall, data are acceptable and usable for project objectives. The laboratory flags (*, F1) to denote out of criteria results were removed. Several results were flagged J by the laboratory because the concentrations calculated were below the method reporting limit and above the laboratory detection limit. The J flag was retained. These results should be considered estimated as the calculated concentrations are below the instrument calibration range.

No additional validation actions were taken on project samples. Results are usable for project purposes as validated.

Inorganic Data Review Summary

SDG No. UF22026

Site Calumet Montana Refining

Laboratory Shealy Environmental

Number of Samples/Matrix 2 GW, 1 Water

Reviewer Name R Huening

Completion Date July 16, 2019

Review Criteria	Metals (Modified Skinner List)
Preservation and Holding Times	No issues
Blanks	Zinc detected below the RL in aqueous method blank sample. Project sample detections of zinc well above blank result. No action taken.
Matrix Spike/Matrix Spike Duplicate	No MS/MSD results reported with samples. No action taken.
Laboratory Control Sample	No issues
Duplicate Samples	No issues
Other Non-conformances	No other non-conformances noted during analysis.
Overall Assessment of Data	No validation action warranted.

SDG No. UF22026

Site Calumet Montana Refining

Laboratory Shealy Environmental

Number of Samples/Matrix 2 GW, 1 Water

Reviewer Name R Huening

Completion Date July 16, 2019

Review Criteria	VOC 8260C, SVOC 8270	VPH/EPH
Preservation and Holding Times	Several VOC samples rerun out of hold time due to LCS issues. Results within hold time should be used preferentially. One SVOC sample received with pH greater than 2. pH adjusted at the lab, no action taken.	No issues
Blanks	SVOC bis(2-ethylhexyl)phthalate detected in method blank. All project sample detections validated as non-detect (U). Acetone detected in trip blank. All acetone results validated as non-detect (U).	No issues
Deuterated Monitoring Compound or Surrogate Spikes	No issues	Surrogates out due to matrix interference. No action taken.
Matrix Spike/Matrix Spike Duplicate	No MS/MSD results reported with samples. No action taken.	No MS/MSD results reported with samples. No action taken.
Laboratory Control Sample	LCS out of criteria high for acetone and low for methyl acetate. All aqueous methyl acetate results validated as estimated (J, UJ) and all detected results for acetone validated as estimated (J).	No issues
Internal Standards	No issues	No issues
Tentatively Identified Compounds	No TICs identified by the lab.	N/a
Other Non-conformances	No other non-conformances noted.	CCV out of criteria for some compounds due to matrix interference. No action taken.
Overall Assessment of Data	All aqueous methyl acetate results validated as estimated (J, UJ) and all detected results for acetone validated as estimated (J). All acetone and bis(2-ethylhexyl)phthalate results validated as non-detect (U).	No validation action warranted.

Case Narrative
Ramboll US Corporation
Lot Number: UF22026

This Report of Analysis contains the analytical result(s) for the sample(s) listed on the Sample Summary following this Case Narrative. The sample receiving date is documented in the header information associated with each sample.

All results listed in this report relate only to the samples that are contained within this report.

Sample receipt, sample analysis, and data review have been performed in accordance with the most current approved NELAC standards, the Shealy Environmental Services, Inc. ("Shealy") Quality Assurance Management Plan (QAMP), standard operating procedures (SOPs), and Shealy policies. Any exceptions to the NELAC standards, the QAMP, SOPs or policies are qualified on the results page or discussed below.

If you have any questions regarding this report please contact the Shealy Project Manager listed on the cover page.

Volatiles
The laboratory control sample (LCS) associated with batch 21545 had acetone recovered above the acceptance limits. This could potentially result in a high bias on analytical results. Samples -001, and -002 were re-analyzed outside of the holding time for confirmation. Both sets of data are reported. The LCS associated with batch 21545 had methyl acetate recovered marginally outside of the acceptance limits. Due to the large number of analytes in the LCS, there is a high statistical probability of a few analytes outside of control limits. Per SW-846 Update V 8000D- 23 Revision 4 July 2014, a number of analytes should be allowed to marginally fail the limits without requirement for corrective action. The laboratory's SOP allows for 10% of analytes to recover marginally outside criteria.

Semivolatiles
The method blank associated with batch 20650 had bis(2-ethylhexyl)phthalate detected at a concentration that was below the LOQ. All samples associated with this method blank that have detections for bis(2-ethylhexyl)phthalate have been flagged with a “B” qualifier. Samples -001 and -002 were diluted 5X due to the sample matrix. The reporting limits have been raised accordingly.

Montana VPH
Samples -001 and -002 had naphthalene detected in the VPH analysis and confirmed via dual detector analysis (FID/PID). However, additional compounds elute at approximately the same times as naphthalene and MTBE, making it difficult for analysts to distinguish the target compounds from non-target compounds. Second method confirmation was performed via GC/MS analysis. The results via dual detection (FID/PID) were not compared to or adjusted based on results via 8260B GC/MS.

The closing continuing calibration verification (CCV) associated with samples -001, -002, and -003 was recovered outside of the acceptance limits due to objective evidence of matrix interference.

The closing continuing calibration verification (CCV) associated with samples -001 and -002 had compounds recovered outside of the acceptance limits due to objective evidence of matrix interference.

Samples -001 and -002 had surrogates recovered outside of the acceptance limits due to objective evidence of matrix interference.

Metals

The method blank associated with batch 20830 had zinc detected at a concentration that was below the LOQ. All samples associated with this method blank that have detections for zinc have been flagged with a "B" qualifier.

LOQ = Limit of Quantitation
B = Detected in the method blank
E = Quantitation of compound exceeded the calibration range
DL = Detection Limit
ND = Not detected at or above the DL
N = Recovery is out of criteria
P = The RPD between two GC columns exceeds 40%
J = Estimated result < LOQ and ≥ DL
H = Out of holding time
W = Reported on wet weight basis

☐ Yes	☐ No	☑ NA	3. If temperature of any cooler exceeded 6.0°C, was Project Manager Notified? PM was Notified by: phone / email / face-to-face (circle one).
☑ Yes	☐ No	☐ NA	4. Is the commercial courier's packing slip attached to this form?
☑ Yes	☐ No		5. Were proper custody procedures (relinquished/received) followed?
☑ Yes	☐ No		6. Were sample IDs listed on the COC?
☑ Yes	☐ No		7. Were sample IDs listed on all sample containers?
☑ Yes	☐ No		8. Was collection date & time listed on the COC?
☑ Yes	☐ No		9. Was collection date & time listed on all sample containers?
☑ Yes	☐ No		10. Did all container label information (ID, date, time) agree with the COC?
☑ Yes	☐ No		11. Were tests to be performed listed on the COC?
☐ Yes	☑ No		12. Did all samples arrive in the proper containers for each test and/or in good condition (unbroken, lids on, etc.)? Broken: 1 of 2 vials for TB-20
☑ Yes	☐ No		13. Was adequate sample volume available?
☑ Yes	☐ No		14. Were all samples received within ½ the holding time or 48 hours, whichever comes first?
☐ Yes	☑ No		15. Were any samples containers missing/excess (circle one) samples Not listed on COC?
☑ Yes	☐ No	☐ NA	16. For VOA and RSK-175 samples, were bubbles present >"pea-size" (¼"or 6mm in diameter) in any of the VOA vials?
☐ Yes	☐ No	☑ NA	17. Were all DRO/metals/nutrient samples received at a pH of < 2?
☐ Yes	☐ No	☑ NA	18. Were all cyanide samples received at a pH > 12 and sulfide samples received at a pH > 9?
☐ Yes	☐ No	☑ NA	19. Were all applicable NH_3/TKN/cyanide/phenol/625 (< 0.5mg/L) samples free of residual chlorine?
☐ Yes	☐ No	☑ NA	20. Were client remarks/requests (i.e. requested dilutions, MS/MSD designations, etc…) correctly transcribed from the COC into the comment section in LIMS?
☐ Yes	☑ No		21. Was the quote number listed on the container label? If yes, Quote # NA

Sample Preservation (Must be completed for any sample(s) incorrectly preserved or with headspace.)

Sample(s) NA _____ were received incorrectly preserved and were adjusted accordingly in sample receiving with NA mL of circle one: H2SO4, HNO3, HCl, NaOH using SR # NA .
Time of preservation NA . If more than one preservative is needed, please note in the comments below.

Sample(s) UF22026-003 were received with bubbles >6 mm in diameter.

Samples(s) NA were received with TRC > 0.5 mg/L (If #19 is ***no***) and were adjusted accordingly in sample receiving with sodium thiosulfate ($Na_2S_2O_3$) with Shealy ID: NA .

MEMO

Date: **July 22, 2019**

To: **File**

From: **Rob Huening, Ramboll**

cc: **Daniel J Price, Ramboll**

Subject: **Calumet Montana Refining**
Data Usability Assessment
Methods 8260C, 8270, 6020A, MT EPH/VPH
SDG UF24002, 3 Groundwater Samples, 1 Water Sample

Data validation and usability assessment was conducted for data package UF24002 based on the National Functional Guidelines for Superfund Organic Methods Data Review OSWER 9355.0-132, EPA-540-R-014-002 (USEPA August 2014) and National Functional Guidelines for Superfund Inorganic Methods Data Review (USEPA August 2014). The following samples were reported in this data package:

Sample ID	Lab Sample ID
CMR-WB10-3.0-4.0-190621	UF24002-001
CMR-WB10-6.0-7.0-190621	UF24002-002
CMR-WB10-9.0-9.5-190621	UF24002-003
TB-21-20190621	UF24002-004

Data validation included a review of the following QC parameters:

- Data Package Completeness
- Preservation and Holding Times
- Instrument Performance Check
- Blanks
- Deuterated Monitoring Compound or Surrogate Spikes
- Matrix Spike/Matrix Spike Duplicate
- Field Duplicate Samples
- Laboratory Control Sample
- Internal Standards
- Tentatively Identified Compounds
- System Performance
- Overall Assessment of Data

QC criteria were met for each parameter with the following exceptions:

Surrogates/Internal Standards
Surrogates and/or internal standards were out of criteria for several samples analyzes. Surrogates out of criteria can indicate a possible accuracy bias. However, according to the lab narrative the recovery issues were likely due to sample dilutions or matrix effects. Therefore no results have been validated.

LCS/LCSD Recoveries
During analysis LCS/LCSD samples were run and recoveries were reported. These recoveries were largely in criteria with the exception of aqueous chloromethane and solid bromomethane. The out of criteria recoveries indicate a possible bias. Low recoveries indicate a possible low bias and high recoveries indicate a possible high bias. In general, high bias does not affect non-detect results. Based on the potential bias all aqueous chloromethane and solid bromomethane results have been validated as estimated.

Overall Assessment of Data
Overall, data are acceptable and usable for project objectives. The laboratory flags (*, F1) to denote out of criteria results were removed. Several results were flagged J by the laboratory because the concentrations calculated were below the method reporting limit and above the laboratory detection limit. The J flag was retained. These results should be considered estimated as the calculated concentrations are below the instrument calibration range.

No additional validation actions were taken on project samples. Results are usable for project purposes as validated.

Inorganic Data Review Summary

SDG No. UF24002

Site Calumet Montana Refining

Laboratory Shealy Environmental

Number of Samples/Matrix 3 Soil, 1 Water

Reviewer Name R Huening

Completion Date July 16, 2019

Review Criteria	Metals (Modified Skinner List)
Preservation and Holding Times	No issues
Blanks	No issues
Matrix Spike/Matrix Spike Duplicate	No MS/MSD results reported with samples. No action taken.
Laboratory Control Sample	No issues
Duplicate Samples	No issues
Other Non-conformances	No other non-conformances noted during analysis.
Overall Assessment of Data	No validation action warranted.

SDG No. UF24002

Site Calumet Montana Refining

Laboratory Shealy Environmental

Number of Samples/Matrix 3 Soil, 1 Water

Reviewer Name R Huening

Completion Date July 16, 2019

Review Criteria	VOC 8260C, SVOC 8270	VPH/EPH
Preservation and Holding Times	No issues	No issues
Blanks	No issues	No issues
Deuterated Monitoring Compound or Surrogate Spikes	Surrogates out due to sample dilution, no action taken.	Surrogates out due to matrix interference. No action taken.
Matrix Spike/Matrix Spike Duplicate	No MS/MSD results reported with samples. No action taken.	No MS/MSD results reported with samples. No action taken.
Laboratory Control Sample	LCS out of criteria low for chloromethane (aqueous) and bromomethane (solids). All results for chloromethane (aqueous) and bromomethane (solids) results validated as estimated (J, UJ).	No issues
Internal Standards	No issues	No issues
Tentatively Identified Compounds	No TICs identified by the lab.	N/a
Other Non-conformances	No other non-conformances noted.	No other non-conformances noted.
Overall Assessment of Data	All results for chloromethane (aqueous) and bromomethane (solids) results validated as estimated (J, UJ).	No validation action warranted.

Case Narrative
Ramboll US Corporation
Lot Number: UF24002

This Report of Analysis contains the analytical result(s) for the sample(s) listed on the Sample Summary following this Case Narrative. The sample receiving date is documented in the header information associated with each sample.

All results listed in this report relate only to the samples that are contained within this report.

Sample receipt, sample analysis, and data review have been performed in accordance with the most current approved NELAC standards, the Shealy Environmental Services, Inc. ("Shealy") Quality Assurance Management Plan (QAMP), standard operating procedures (SOPs), and Shealy policies. Any exceptions to the NELAC standards, the QAMP, SOPs or policies are qualified on the results page or discussed below.

Where applicable, all soil sample analysis are reported on a dry weight basis unless flagged with a "W" qualifier

If you have any questions regarding this report please contact the Shealy Project Manager listed on the cover page.

Volatiles
The laboratory control sample (LCS) associated with batch 21588 had chloroethane recovered marginally outside of the acceptance limits. The LCS associated with batch 51695 had bromomethane recovered marginally outside of the acceptance limits. Due to the large number of analytes in the LCS, there is a high statistical probability of a few analytes outside of control limits. Per SW-846 Update V 8000D- 23 Revision 4 July 2014, a number of analytes should be allowed to marginally fail the limits without requirement for corrective action. The laboratory's SOP allows for 10% of analytes to recover marginally outside criteria.

Semivolatiles
Sample -001 was diluted 25X due to high concentrations of the target compounds. As a result, the associated surrogates were recovered outside of the acceptance limits. No corrective action was required, as dilutions of 5X and greater impact recovery accuracy.

Montana VPH
Samples -001 and -002 had naphthalene detected in the VPH analysis and confirmed via dual detector analysis (FID/PID). However, additional compounds elute at approximately the same times as naphthalene and MTBE, making it difficult for analysts to distinguish the target compounds from non-target compounds. Second method confirmation was performed via GC/MS analysis. The results via dual detection (FID/PID) were not compared to or adjusted based on results via 8260B GC/MS.

Samples -001 and -002 had surrogates recovered outside of the acceptance limits due to objective evidence of matrix interference.

LOQ = Limit of Quantitation
B = Detected in the method blank
E = Quantitation of compound exceeded the calibration range
DL = Detection Limit
ND = Not detected at or above the DL
N = Recovery is out of criteria
P = The RPD between two GC columns exceeds 40%
J = Estimated result < LOQ and ≥ DL
H = Out of holding time
W = Reported on wet weight basis

MEMO

Date: **July 22, 2019**

To: **File**

From: **Rob Huening, Ramboll**

cc: **Daniel J Price, Ramboll**

Subject: **Calumet Montana Refining**
Data Usability Assessment
Methods 8260C, 8270, 6020A, MT EPH/VPH
SDG UF25037, 2 Groundwater Samples, 1 Water Sample

Data validation and usability assessment was conducted for data package UF25037 based on the National Functional Guidelines for Superfund Organic Methods Data Review OSWER 9355.0-132, EPA-540-R-014-002 (USEPA August 2014) and National Functional Guidelines for Superfund Inorganic Methods Data Review (USEPA August 2014). The following samples were reported in this data package:

Sample ID	Lab Sample ID
CMR-WB03S-190622	UF25037-001
CMR-WB02S-190622	UF25037-002
TB-22-20190622	UF25037-003

Data validation included a review of the following QC parameters:

- Data Package Completeness
- Preservation and Holding Times
- Instrument Performance Check
- Blanks
- Deuterated Monitoring Compound or Surrogate Spikes
- Matrix Spike/Matrix Spike Duplicate
- Field Duplicate Samples
- Laboratory Control Sample
- Internal Standards
- Tentatively Identified Compounds
- System Performance
- Overall Assessment of Data

QC criteria were met for each parameter with the following exceptions:

Surrogates/Internal Standards
Surrogates and/or internal standards were out of criteria for several samples analyzes. Surrogates out of criteria can indicate a possible accuracy bias. However, according to the lab narrative the recovery issues were likely due to sample dilutions or matrix effects. Therefore no results have been validated.

MS/MSD Recoveries
For the VOC and SVOC analysis suites MS/MSD results were reported. Recoveries were largely within criteria with the exception of 2-methylphenol, 3&4-methylphenol, and phenol. These out of criteria recoveries indicate a possible bias to results. Therefore, all 2-methylphenol, 3&4-methylphenol, and phenol results were flagged as estimated (J, UJ).

Blank Detections
During analysis, acetone was detected in trip blank samples. This indicates a possible cross-contamination issue. Due to this, all low level detections should be evaluated for possible contamination bias. All acetone results below the RL or below 5x the blank result have been validated as non-detect (U).

Overall Assessment of Data
Overall, data are acceptable and usable for project objectives. The laboratory flags (*, F1) to denote out of criteria results were removed. Several results were flagged J by the laboratory because the concentrations calculated were below the method reporting limit and above the laboratory detection limit. The J flag was retained. These results should be considered estimated as the calculated concentrations are below the instrument calibration range.

No additional validation actions were taken on project samples. Results are usable for project purposes as validated.

Inorganic Data Review Summary

SDG No. UF25037

Site Calumet Montana Refining

Laboratory Shealy Environmental

Number of Samples/Matrix 2 GW, 1 Water

Reviewer Name R Huening

Completion Date July 16, 2019

Review Criteria	Metals (Modified Skinner List)
Preservation and Holding Times	No issues
Blanks	No issues
Matrix Spike/Matrix Spike Duplicate	No MS/MSD results reported with samples. No action taken.
Laboratory Control Sample	No issues
Duplicate Samples	No issues
Other Non-conformances	No other non-conformances noted during analysis.
Overall Assessment of Data	No validation action warranted.

SDG No. UF25037

Site Calumet Montana Refining

Laboratory Shealy Environmental

Number of Samples/Matrix 2 GW, 1 Water

Reviewer Name R Huening

Completion Date July 16, 2019

Review Criteria	VOC 8260C, SVOC 8270	VPH/EPH
Preservation and Holding Times	No issues	No issues
Blanks	Bis(2-ethylhexyl)phthalate detected in method blank. No project detections. No action taken. Acetone detected in trip blank. Project sample detections of acetone validated as non-detect (U).	No issues
Deuterated Monitoring Compound or Surrogate Spikes	Surrogates out due to sample dilution, no action taken.	No issues
Matrix Spike/Matrix Spike Duplicate	2-Methylphenol, 3&4-methylphenol, and phenol recovered low in MS/MSD sample. All 2-methylphenol, 3&4-methylphenol, and phenol results validated as estimated (J, UJ).	No MS/MSD results reported with samples. No action taken.
Laboratory Control Sample	LCS out of high for acetone. See above.	No issues
Internal Standards	No issues	No issues
Tentatively Identified Compounds	No TICs identified by the lab.	N/a
Other Non-conformances	CCV out of criteria high for acetone. See above.	No other non-conformances noted.
Overall Assessment of Data	All 2-methylphenol, 3&4-methylphenol, and phenol results validated as estimated (J, UJ). Project sample detections of acetone validated as non-detect (U).	No validation action warranted.

Case Narrative
Ramboll US Corporation
Lot Number: UF25037

This Report of Analysis contains the analytical result(s) for the sample(s) listed on the Sample Summary following this Case Narrative. The sample receiving date is documented in the header information associated with each sample.

All results listed in this report relate only to the samples that are contained within this report.

Sample receipt, sample analysis, and data review have been performed in accordance with the most current approved NELAC standards, the Shealy Environmental Services, Inc. ("Shealy") Quality Assurance Management Plan (QAMP), standard operating procedures (SOPs), and Shealy policies. Any exceptions to the NELAC standards, the QAMP, SOPs or policies are qualified on the results page or discussed below.

If you have any questions regarding this report please contact the Shealy Project Manager listed on the cover page.

Volatiles
The laboratory control sample (LCS) associated with batch 21644 had acetone recovered above the acceptance limits. This could potentially result in a high bias on analytical results. There were no detections above the LOQ for this compound in the samples associated with this batch; therefore, data quality is not impacted.

The continuing calibration verification (CCV) associated with samples -001, -002, and -003 had acetone recovered above the acceptance limits. This could potentially result in a high bias on analytical results. There were no detections above the LOQ for this compound in the associated samples; therefore, data quality is not impacted.

Semivolatiles
The method blank associated with batch 21123 had bis(2-ethylhexyl)phthalate detected at a concentration that was below the LOQ. There were no detections for this compound in the samples associated with this method blank.

The LCS associated with batch 21123 had phenol recovered marginally outside of the acceptance limits. Due to the large number of analytes in the LCS, there is a high statistical probability of a few analytes outside of control limits. Per SW-846 Update V 8000D- 23 Revision 4 July 2014, a number of analytes should be allowed to marginally fail the limits without requirement for corrective action. The laboratory's SOP allows for 10% of analytes to recover marginally outside criteria.

The matrix spike/matrix spike duplicate (MS/MSD) associated with sample -001 had mutliple compounds recovered outside of the acceptance limits. The LCS was recovered within the required acceptance limits; therefore, this likely demonstrates a matrix effect.

Samples -001 and -002 were diluted 5X and 10X, respectively, due to the sample matrix. The reporting limits have been raised accordingly.

Sample Summary

1,1,2-Trichloroethane	79-00-5	8260B	ND		0.50	0.40	ug/L	1
Trichloroethene	79-01-6	8260B	ND		0.50	0.40	ug/L	1
Trichlorofluoromethane	75-69-4	8260B	ND		0.50	0.40	ug/L	1
Vinyl chloride	75-01-4	8260B	ND		0.50	0.40	ug/L	1
Xylenes (total)	1330-20-7	8260B	ND		1.0	0.40	ug/L	1
m+p - Xylenes	179601-23-1	8260B	ND		0.50	0.40	ug/L	1
o - Xylenes	95-47-6	8260B	ND		0.50	0.40	ug/L	1

Surrogate	Q	Run 1 % Recovery	Acceptance Limits
1,2-Dichloroethane-d4		91	70-130
Bromofluorobenzene		103	70-130
Toluene-d8		99	70-130

LOQ = Limit of Quantitation
B = Detected in the method blank
E = Quantitation of compound exceeded the calibration range
DL = Detection Limit
ND = Not detected at or above the DL
N = Recovery is out of criteria
P = The RPD between two GC columns exceeds 40%
J = Estimated result < LOQ and ≥ DL
H = Out of holding time
W = Reported on wet weight basis

QC Summary

Volatile Organic Compounds by GC/MS - MB

Sample ID: UQ21644-001
Batch: 21644
Analytical Method: 8260B

Matrix: Aqueous
Prep Method: 5030B

Parameter	Result	Q	Dil	LOQ	DL	Units	Analysis Date
Acetone	ND		1	10	2.0	ug/L	07/05/2019 1110
Benzene	ND		1	0.50	0.40	ug/L	07/05/2019 1110
Bromochloromethane	ND		1	0.50	0.40	ug/L	07/05/2019 1110
Bromodichloromethane	ND		1	0.50	0.40	ug/L	07/05/2019 1110
Bromoform	ND		1	0.50	0.40	ug/L	07/05/2019 1110
Bromomethane (Methyl bromide)	ND		1	0.50	0.40	ug/L	07/05/2019 1110
2-Butanone (MEK)	ND		1	10	2.0	ug/L	07/05/2019 1110
Carbon disulfide	ND		1	0.50	0.40	ug/L	07/05/2019 1110
Carbon tetrachloride	ND		1	0.50	0.40	ug/L	07/05/2019 1110
Chlorobenzene	ND		1	0.50	0.40	ug/L	07/05/2019 1110
Chloroethane	ND		1	0.50	0.40	ug/L	07/05/2019 1110
Chloroform	ND		1	0.50	0.40	ug/L	07/05/2019 1110
Chloromethane (Methyl chloride)	ND		1	0.50	0.40	ug/L	07/05/2019 1110
Cyclohexane	ND		1	0.50	0.40	ug/L	07/05/2019 1110
1,2-Dibromo-3-chloropropane (DBCP)	ND		1	0.50	0.40	ug/L	07/05/2019 1110
Dibromochloromethane	ND		1	0.50	0.40	ug/L	07/05/2019 1110

LOQ = Limit of Quantitation
DL = Detection Limit
LOD = Limit of Detection

P = The RPD between two GC columns exceeds 40%
J = Estimated result < LOQ and ≥ DL
ND = Not detected at or above the DL

N = Recovery is out of criteria
+ = RPD is out of criteria

Note: Calculations are performed before rounding to avoid round-off errors in calculated results

Sample Receipt Checklist (SRC)

Client: RAMBOLL Cooler Inspected by/date: LKH / 06-25-2019 Lot #: UF25037

Means of receipt: ☐ SESI ☐ Client ☐ UPS ☑ FedEx ☐ Other: _____

☑ Yes	☐ No		1. Were custody seals present on the cooler?
☑ Yes	☐ No	☐ NA	2. If custody seals were present, were they intact and unbroken?

pH Strip ID: 18-2225 Chlorine Strip ID: NA Tested by: LKH

Original temperature upon receipt / Derived (Corrected) temperature upon receipt %Solid Snap-Cup ID: NA

2.5 / 2.5 °C NA / NA °C NA / NA °C NA / NA °C

Method: ☑ Temperature Blank ☐ Against Bottles IR Gun ID: 6 IR Gun Correction Factor: 0 °C

Method of coolant: ☑ Wet Ice ☐ Ice Packs ☐ Dry Ice ☐ None

☐ Yes	☐ No	☑ NA	3. If temperature of any cooler exceeded 6.0°C, was Project Manager Notified? PM was Notified by: phone / email / face-to-face (circle one).
☑ Yes	☐ No	☐ NA	4. Is the commercial courier's packing slip attached to this form?
☑ Yes	☐ No		5. Were proper custody procedures (relinquished/received) followed?
☑ Yes	☐ No		6. Were sample IDs listed on the COC?
☑ Yes	☐ No		7. Were sample IDs listed on all sample containers?
☑ Yes	☐ No		8. Was collection date & time listed on the COC?
☑ Yes	☐ No		9. Was collection date & time listed on all sample containers?
☑ Yes	☐ No		10. Did all container label information (ID, date, time) agree with the COC?
☑ Yes	☐ No		11. Were tests to be performed listed on the COC?
☑ Yes	☐ No		12. Did all samples arrive in the proper containers for each test and/or in good condition (unbroken, lids on, etc.)?
☑ Yes	☐ No		13. Was adequate sample volume available?
☑ Yes	☐ No		14. Were all samples received within ½ the holding time or 48 hours, whichever comes first?
☐ Yes	☑ No		15. Were any samples containers missing/excess (circle one) samples Not listed on COC?
☑ Yes	☐ No	☐ NA	16. For VOA and RSK-175 samples, were bubbles present >"pea-size" (¼"or 6mm in diameter) in any of the VOA vials?
☑ Yes	☐ No	☐ NA	17. Were all DRO/metals/nutrient samples received at a pH of < 2?
☐ Yes	☐ No	☑ NA	18. Were all cyanide samples received at a pH > 12 and sulfide samples received at a pH > 9?
☐ Yes	☐ No	☑ NA	19. Were all applicable NH_3/TKN/cyanide/phenol/625 (< 0.5mg/L) samples free of residual chlorine?
☐ Yes	☐ No	☑ NA	20. Were client remarks/requests (i.e. requested dilutions, MS/MSD designations, etc…) correctly transcribed from the COC into the comment section in LIMS?
☐ Yes	☑ No		21. Was the quote number listed on the container label? If yes, Quote # NA

Sample Preservation (Must be completed for any sample(s) incorrectly preserved or with headspace.)

Sample(s) NA _____ were received incorrectly preserved and were adjusted accordingly in sample receiving with NA mL of circle one: H2SO4, HNO3, HCl, NaOH using SR # NA.

Time of preservation NA. If more than one preservative is needed, please note in the comments below.

Sample(s) 003(2) were received with bubbles >6 mm in diameter.

Samples(s) NA were received with TRC > 0.5 mg/L (If #19 is ***no***) and were adjusted accordingly in sample receiving with sodium thiosulfate ($Na_2S_2O_3$) with Shealy ID: NA.

MEMO

Date: **July 22, 2019**

To: **File**

From: **Rob Huening, Ramboll**

cc: **Daniel J Price, Ramboll**

Subject: **Calumet Montana Refining**
Data Usability Assessment
Methods 8260C, 8270, 6020A, MT EPH/VPH
SDG UF25038, 4 Soil Samples, 1 Water Sample

Data validation and usability assessment was conducted for data package UF25038 based on the National Functional Guidelines for Superfund Organic Methods Data Review OSWER 9355.0-132, EPA-540-R-014-002 (USEPA August 2014) and National Functional Guidelines for Superfund Inorganic Methods Data Review (USEPA August 2014). The following samples were reported in this data package:

Sample ID	Lab Sample ID
CMR-WB01-1.5-2.0-190622	UF25038-001
CMR-WB01-3.0-4.0-190622	UF25038-002
CMR-WB01-6.0-6.5-190622	UF25038-003
CMR-WB01-6.0-6.5-190622-DUP	UF25038-004
TB-24-20190622	UF25038-005

Data validation included a review of the following QC parameters:

- Data Package Completeness
- Preservation and Holding Times
- Instrument Performance Check
- Blanks
- Deuterated Monitoring Compound or Surrogate Spikes
- Matrix Spike/Matrix Spike Duplicate
- Field Duplicate Samples
- Laboratory Control Sample
- Internal Standards
- Tentatively Identified Compounds
- System Performance
- Overall Assessment of Data

QC criteria were met for each parameter with the following exceptions:

Surrogates/Internal Standards
Surrogates and/or internal standards were out of criteria for several samples analyzes. Surrogates out of criteria can indicate a possible accuracy bias. However, according to the lab narrative the recovery issues were likely due to sample dilutions or matrix effects. Therefore no results have been validated.

MS/MSD Recoveries
For the metals analysis suites MS/MSD results were reported. Recoveries were largely within criteria with the exception of beryllium. These out of criteria recoveries indicate a possible bias to results. Therefore, all beryllium results were flagged as estimated (J, UJ).

LCS/LCSD Recoveries
During analysis LCS/LCSD samples were run and recoveries were reported. These recoveries were largely in criteria with the exception of methyl acetate and bromomethane. The out of criteria recoveries indicate a possible bias. Low recoveries indicate a possible low bias and high recoveries indicate a possible high bias. In general, high bias does not affect non-detect results. Based on the potential bias all methyl acetate and bromomethane results have been validated as estimated.

Blank Detections
During analysis, acetone was detected in trip blank samples. This indicates a possible cross-contamination issue. Due to this, all low level detections should be evaluated for possible contamination bias. All acetone results below the RL or below 5x the blank result have been validated as non-detect (U).

Overall Assessment of Data
Overall, data are acceptable and usable for project objectives. The laboratory flags (*, F1) to denote out of criteria results were removed. Several results were flagged J by the laboratory because the concentrations calculated were below the method reporting limit and above the laboratory detection limit. The J flag was retained. These results should be considered estimated as the calculated concentrations are below the instrument calibration range.

No additional validation actions were taken on project samples. Results are usable for project purposes as validated.

Inorganic Data Review Summary

SDG No. UF25038

Site Calumet Montana Refining

Laboratory Shealy Environmental

Number of Samples/Matrix 4 Soil, 1 Water

Reviewer Name R Huening

Completion Date July 16, 2019

Review Criteria	Metals (Modified Skinner List)
Preservation and Holding Times	No issues
Blanks	No issues
Matrix Spike/Matrix Spike Duplicate	MS/MSD recoveries out for multiple metals, likely due to high native sample concentrations. Beryllium out of criteria with acceptable spike. All beryllium results validated as estimated (J, UJ).
Laboratory Control Sample	No issues
Duplicate Samples	One field duplicate submitted. RPDs acceptable, no action taken.
Other Non-conformances	No other non-conformances noted during analysis.
Overall Assessment of Data	All beryllium results validated as estimated (J, UJ).

SDG No. UF25038

Site Calumet Montana Refining

Laboratory Shealy Environmental

Number of Samples/Matrix 4 Solid, 1 Water

Reviewer Name R Huening

Completion Date July 16, 2019

Review Criteria	VOC 8260C, SVOC 8270	VPH/EPH
Preservation and Holding Times	No issues	No issues
Blanks	Acetone detected in trip blank sample. Acetone detections validated as non-detect (U).	No issues
Deuterated Monitoring Compound or Surrogate Spikes	Surrogates out due to sample dilution, no action taken.	Surrogates out die to matrix interference/dilution, no action taken.
Matrix Spike/Matrix Spike Duplicate	No MS/MSD results reported with samples. No action taken.	No MS/MSD results reported with samples. No action taken.
Laboratory Control Sample	LCS out of high for acetone. See above. LCS out low for methyl acetate and bromomethane. All methyl acetate and bromomethane results validated as estimated (J, UJ).	No issues
Field Duplicates	One FD submitted. RPDs show acceptable agreement. No action taken.	One FD submitted. RPDs show acceptable agreement. No action taken.
Internal Standards	No issues	No issues
Tentatively Identified Compounds	No TICs identified by the lab.	N/a
Other Non-conformances	CCV out of criteria high for acetone. See above.	No other non-conformances noted.
Overall Assessment of Data	All methyl acetate and bromomethane results validated as estimated (J, UJ). Acetone detections validated as non-detect (U).	No validation action warranted.

Case Narrative
Ramboll US Corporation
Lot Number: UF25038

This Report of Analysis contains the analytical result(s) for the sample(s) listed on the Sample Summary following this Case Narrative. The sample receiving date is documented in the header information associated with each sample.

All results listed in this report relate only to the samples that are contained within this report.

Sample receipt, sample analysis, and data review have been performed in accordance with the most current approved NELAC standards, the Shealy Environmental Services, Inc. ("Shealy") Quality Assurance Management Plan (QAMP), standard operating procedures (SOPs), and Shealy policies. Any exceptions to the NELAC standards, the QAMP, SOPs or policies are qualified on the results page or discussed below.

Where applicable, all soil sample analysis are reported on a dry weight basis unless flagged with a "W" qualifier

If you have any questions regarding this report please contact the Shealy Project Manager listed on the cover page.

Volatiles
The laboratory control sample (LCS) associated with batch 21644 had acetone recovered above the acceptance limits. This could potentially result in a high bias on analytical results. There were no detections above the LOQ for this compound in the samples associated with this batch; therefore, data quality is not impacted.

The LCS associated with batch 21458 had methyl acetate recovered marginally outside of the acceptance limits. The LCS associated with batch 21460 had bromomethane recovered marginally outside of the acceptance limits. Due to the large number of analytes in the LCS, there is a high statistical probability of a few analytes outside of control limits. Per SW-846 Update V 8000D- 23 Revision 4 July 2014, a number of analytes should be allowed to marginally fail the limits without requirement for corrective action. The laboratory's SOP allows for 10% of analytes to recover marginally outside criteria.

The continuing calibration verification (CCV) associated with sample -005 had acetone recovered above the acceptance limits. This could potentially result in a high bias on analytical results. There were no detections above the LOQ for this compound in the associated samples; therefore, data quality is not impacted.

Sample -004 had the surrogate recovered outside of the acceptance limits due to sample dilution. Sample -003 was analyzed high level due to the sample matrix. The reporting limits have been raised accordingly.

Semivolatiles
Samples -001, -003, and -004 were diluted 5X, 50X, and 50X, respectively, due to high concentrations of target compounds. As a result, the associated surrogates were recovered outside of the acceptance limits. No corrective action was required, as dilutions of 5X and greater impact recovery accuracy.

Sample -002 was diluted 25X due to the sample matrix. The reporting limits have been raised accordingly. The associated surrogates were recovered outside of the acceptance limits. No corrective action was required, as dilutions of 5X and greater impact recovery accuracy.

Montana EPH
Sample -003 was diluted 10X due to high concentrations of target compounds. As a result, the associated surrogates were recovered outside of the acceptance limits. No corrective action was required, as dilutions of 5X and greater impact recovery accuracy.

Montana VPH
Samples -002, -003, and -004 had naphthalene detected in the VPH analysis and confirmed via dual detector analysis (FID/PID). However, additional compounds elute at approximately the same times as naphthalene and MTBE, making it difficult for analysts to distinguish the target compounds from non-target compounds. Second method confirmation was performed via GC/MS analysis. The results via dual detection (FID/PID) were not compared to or adjusted based on results via 8260B GC/MS. Samples -002, -003 and -004 had surrogates recovered outside of the acceptance limits due to objective evidence of matrix interference.

Metals
The matrix spike/matrix spike duplicate (MS/MSD) associated with sample -004 had multiple metals recovered outside of the acceptance limits. Additionally, a number of RPDs exceeded the acceptance limit. The LCS was recovered within the required acceptance limits; therefore, this likely demonstrates a matrix effect.

Sample Receipt Checklist (SRC)

Client: RAMBOLL Cooler Inspected by/date: LKH / 06-25-2019 Lot #: UF25038

Means of receipt: ☐ SESI ☐ Client ☐ UPS ☑ FedEx ☐ Other: _____

☑ Yes	☐ No		1. Were custody seals present on the cooler?
☑ Yes	☐ No	☐ NA	2. If custody seals were present, were they intact and unbroken?

pH Strip ID: NA Chlorine Strip ID: NA Tested by: NA

Original temperature upon receipt / Derived (Corrected) temperature upon receipt %Solid Snap-Cup ID: 19-611

3.6 / 3.6 °C NA / NA °C NA / NA °C NA / NA °C

Method: ☑ Temperature Blank ☐ Against Bottles IR Gun ID: 6 IR Gun Correction Factor: 0 °C

Method of coolant: ☑ Wet Ice ☐ Ice Packs ☐ Dry Ice ☐ None

☐ Yes	☐ No	☑ NA	3. If temperature of any cooler exceeded 6.0°C, was Project Manager Notified? PM was Notified by: phone / email / face-to-face (circle one).
☑ Yes	☐ No	☐ NA	4. Is the commercial courier's packing slip attached to this form?
☑ Yes	☐ No		5. Were proper custody procedures (relinquished/received) followed?
☑ Yes	☐ No		6. Were sample IDs listed on the COC?
☑ Yes	☐ No		7. Were sample IDs listed on all sample containers?
☑ Yes	☐ No		8. Was collection date & time listed on the COC?
☑ Yes	☐ No		9. Was collection date & time listed on all sample containers?
☑ Yes	☐ No		10. Did all container label information (ID, date, time) agree with the COC?
☑ Yes	☐ No		11. Were tests to be performed listed on the COC?
☑ Yes	☐ No		12. Did all samples arrive in the proper containers for each test and/or in good condition (unbroken, lids on, etc.)? _____
☑ Yes	☐ No		13. Was adequate sample volume available?
☑ Yes	☐ No		14. Were all samples received within ½ the holding time or 48 hours, whichever comes first?
☐ Yes	☑ No		15. Were any samples containers missing/excess (circle one) samples Not listed on COC?
☑ Yes	☐ No	☐ NA	16. For VOA and RSK-175 samples, were bubbles present >"pea-size" (¼" or 6mm in diameter) in any of the VOA vials?
☐ Yes	☐ No	☑ NA	17. Were all DRO/metals/nutrient samples received at a pH of < 2?
☐ Yes	☐ No	☑ NA	18. Were all cyanide samples received at a pH > 12 and sulfide samples received at a pH > 9?
☐ Yes	☐ No	☑ NA	19. Were all applicable NH_3/TKN/cyanide/phenol/625 (< 0.5mg/L) samples free of residual chlorine?
☐ Yes	☐ No	☑ NA	20. Were client remarks/requests (i.e. requested dilutions, MS/MSD designations, etc…) correctly transcribed from the COC into the comment section in LIMS?
☐ Yes	☑ No		21. Was the quote number listed on the container label? If yes, Quote # NA

Sample Preservation (Must be completed for any sample(s) incorrectly preserved or with headspace.)

Sample(s) NA were received incorrectly preserved and were adjusted accordingly in sample receiving with NA mL of circle one: H2SO4, HNO3, HCl, NaOH using SR # NA.
Time of preservation NA. If more than one preservative is needed, please note in the comments below.

Sample(s) 005(2) were received with bubbles >6 mm in diameter.

Samples(s) NA were received with TRC > 0.5 mg/L (If #19 is ***no***) and were adjusted accordingly in sample receiving with sodium thiosulfate ($Na_2S_2O_3$) with Shealy ID: NA.

MEMO

Date: **July 23, 2019**

To: **File**

From: **Rob Huening, Ramboll**

cc: **Daniel J Price, Ramboll**

Subject: **Calumet Montana Refining**
Data Usability Assessment
Methods 8260C, 8270, 6020A, MT EPH/VPH
SDG UF25040, 2 Groundwater Samples, 1 Water Sample

Data validation and usability assessment was conducted for data package UF25040 based on the National Functional Guidelines for Superfund Organic Methods Data Review OSWER 9355.0-132, EPA-540-R-014-002 (USEPA August 2014) and National Functional Guidelines for Superfund Inorganic Methods Data Review (USEPA August 2014). The following samples were reported in this data package:

Sample ID	Lab Sample ID
CMR-WB01S-190624	UF25040-001
CMR-WB01D-190624	UF25040-002
TB-23-20190624	UF25040-003

Data validation included a review of the following QC parameters:

- Data Package Completeness
- Preservation and Holding Times
- Instrument Performance Check
- Blanks
- Deuterated Monitoring Compound or Surrogate Spikes
- Matrix Spike/Matrix Spike Duplicate
- Field Duplicate Samples
- Laboratory Control Sample
- Internal Standards
- Tentatively Identified Compounds
- System Performance
- Overall Assessment of Data

QC criteria were met for each parameter with the following exceptions:

Surrogates/Internal Standards
Surrogates and/or internal standards were out of criteria for several samples analyzes. Surrogates out of criteria can indicate a possible accuracy bias. However, according to the lab narrative the recovery issues were likely due to sample dilutions or matrix effects. Therefore no results have been validated.

LCS/LCSD Recoveries
During analysis LCS/LCSD samples were run and recoveries were reported. These recoveries were largely in criteria with the exception of phenol. The out of criteria recoveries indicate a possible bias. Low recoveries indicate a possible low bias and high recoveries indicate a possible high bias. In general, high bias does not affect non-detect results. Based on the potential bias all phenol results have been validated as estimated.

Blank Detections
During analysis, acetone and bis(2-ethylhexyl)phthalate was detected in trip and method blank samples. This indicates a possible cross-contamination issue. Due to this, all low level detections should be evaluated for possible contamination bias. All acetone and bis(2-ethylhexyl)phthalate results below the RL or below 5x the blank result have been validated as non-detect (U).

Overall Assessment of Data
Overall, data are acceptable and usable for project objectives. The laboratory flags (*, F1) to denote out of criteria results were removed. Several results were flagged J by the laboratory because the concentrations calculated were below the method reporting limit and above the laboratory detection limit. The J flag was retained. These results should be considered estimated as the calculated concentrations are below the instrument calibration range.

No additional validation actions were taken on project samples. Results are usable for project purposes as validated.

Attachment 1: Data Validation Summary Checklist

Inorganic Data Review Summary

SDG No. UF25040

Site Calumet Montana Refining

Laboratory Shealy Environmental

Number of Samples/Matrix 2 GW, 1 Water

Reviewer Name R Huening

Completion Date July 16, 2019

Review Criteria	Metals (Modified Skinner List)
Preservation and Holding Times	No issues
Blanks	No issues
Matrix Spike/Matrix Spike Duplicate	No MS/MSD results reported with samples, no action taken.
Laboratory Control Sample	No issues
Duplicate Samples	No issues
Other Non-conformances	No other non-conformances noted during analysis.
Overall Assessment of Data	No validation action warranted.

SDG No. UF25040

Site Calumet Montana Refining

Laboratory Shealy Environmental

Number of Samples/Matrix 2 GW, 1 Water

Reviewer Name R Huening

Completion Date July 16, 2019

Review Criteria	VOC 8260C, SVOC 8270	VPH/EPH
Preservation and Holding Times	No issues	No issues
Blanks	Bis(2-ethylhexyl)phthalate detected in method blank. All project sample detections of bis(2-ethylhexyl)phthalate validated as non-detect (U). Acetone detected in trip blank. All project sample detections of acetone validated as non-detect (U).	No issues
Deuterated Monitoring Compound or Surrogate Spikes	Surrogates out due to sample dilution, no action taken.	Surrogates out die to matrix interference/dilution, no action taken.
Matrix Spike/Matrix Spike Duplicate	No MS/MSD results reported with samples. No action taken.	No MS/MSD results reported with samples. No action taken.
Laboratory Control Sample	LCS out of high for acetone. See above. LCS out low for phenol. All phenol results validated as estimated (J, UJ).	No issues
Internal Standards	No issues	No issues
Tentatively Identified Compounds	No TICs identified by the lab.	N/a
Other Non-conformances	CCV out of criteria high for acetone. See above.	No other non-conformances noted.
Overall Assessment of Data	All phenol results validated as estimated (J, UJ). All project sample detections of acetone validated as non-detect (U). All project sample detections of bis(2-ethylhexyl)phthalate validated as non-detect (U).	No validation action warranted.

Case Narrative
Ramboll US Corporation
Lot Number: UF25040

This Report of Analysis contains the analytical result(s) for the sample(s) listed on the Sample Summary following this Case Narrative. The sample receiving date is documented in the header information associated with each sample.

All results listed in this report relate only to the samples that are contained within this report.

Sample receipt, sample analysis, and data review have been performed in accordance with the most current approved NELAC standards, the Shealy Environmental Services, Inc. ("Shealy") Quality Assurance Management Plan (QAMP), standard operating procedures (SOPs), and Shealy policies. Any exceptions to the NELAC standards, the QAMP, SOPs or policies are qualified on the results page or discussed below.

If you have any questions regarding this report please contact the Shealy Project Manager listed on the cover page.

Volatiles
The laboratory control sample (LCS) associated with batch 21644 had acetone recovered above the acceptance limits. This could potentially result in a high bias on analytical results. There were no detections above the LOQ for this compound in the samples associated with this batch; therefore, data quality is not impacted.

The continuing calibration verification (CCV) associated with samples -001, -002, and -003 had acetone recovered above the acceptance limits. This could potentially result in a high bias on analytical results. There were no detections above the LOQ for this compound in the associated samples; therefore, data quality is not impacted.

Semivolatiles
The method blank associated with batch 21123 had bis(2-ethylhexyl)phthalate detected at a concentration that was below the LOQ. All samples associated with this method blank that have detections for bis(2-ethylhexyl)phthalate have been flagged with a “B” qualifier.

The LCS associated with batch 21123 had phenol recovered marginally outside of the acceptance limits. Due to the large number of analytes in the LCS, there is a high statistical probability of a few analytes outside of control limits. Per SW-846 Update V 8000D- 23 Revision 4 July 2014, a number of analytes should be allowed to marginally fail the limits without requirement for corrective action. The laboratory's SOP allows for 10% of analytes to recover marginally outside criteria.

Sample -002 was diluted 5X due to the sample matrix. The reporting limits have been raised accordingly.

Method: ☑ Temperature Blank ☐ Against Bottles IR Gun ID: 6 IR Gun Correction Factor: 0 °C

Method of coolant: ☑ Wet Ice ☐ Ice Packs ☐ Dry Ice ☐ None

☐ Yes	☐ No	☑ NA	3. If temperature of any cooler exceeded 6.0°C, was Project Manager Notified? PM was Notified by: phone / email / face-to-face (circle one).
☑ Yes	☐ No	☐ NA	4. Is the commercial courier's packing slip attached to this form?
☑ Yes	☐ No		5. Were proper custody procedures (relinquished/received) followed?
☑ Yes	☐ No		6. Were sample IDs listed on the COC?
☑ Yes	☐ No		7. Were sample IDs listed on all sample containers?
☑ Yes	☐ No		8. Was collection date & time listed on the COC?
☑ Yes	☐ No		9. Was collection date & time listed on all sample containers?
☑ Yes	☐ No		10. Did all container label information (ID, date, time) agree with the COC?
☑ Yes	☐ No		11. Were tests to be performed listed on the COC?
☑ Yes	☐ No		12. Did all samples arrive in the proper containers for each test and/or in good condition (unbroken, lids on, etc.)? ____
☑ Yes	☐ No		13. Was adequate sample volume available?
☑ Yes	☐ No		14. Were all samples received within ½ the holding time or 48 hours, whichever comes first?
☐ Yes	☑ No		15. Were any samples containers missing/excess (circle one) samples Not listed on COC?
☑ Yes	☐ No	☐ NA	16. For VOA and RSK-175 samples, were bubbles present >"pea-size" (¼"or 6mm in diameter) in any of the VOA vials?
☐ Yes	☐ No	☑ NA	17. Were all DRO/metals/nutrient samples received at a pH of < 2?
☐ Yes	☐ No	☑ NA	18. Were all cyanide samples received at a pH > 12 and sulfide samples received at a pH > 9?
☐ Yes	☐ No	☑ NA	19. Were all applicable NH_3/TKN/cyanide/phenol/625 (< 0.5mg/L) samples free of residual chlorine?
☐ Yes	☐ No	☑ NA	20. Were client remarks/requests (i.e. requested dilutions, MS/MSD designations, etc…) correctly transcribed from the COC into the comment section in LIMS?
☐ Yes	☑ No		21. Was the quote number listed on the container label? If yes, Quote # NA

Sample Preservation (Must be completed for any sample(s) incorrectly preserved or with headspace.)

Sample(s) NA were received incorrectly preserved and were adjusted accordingly in sample receiving with NA mL of circle one: H2SO4, HNO3, HCl, NaOH using SR # NA.
Time of preservation NA. If more than one preservative is needed, please note in the comments below.

Sample(s) 003(2) were received with bubbles >6 mm in diameter.

Samples(s) NA were received with TRC > 0.5 mg/L (If #19 is ***no***) and were adjusted accordingly in sample receiving with sodium thiosulfate ($Na_2S_2O_3$) with Shealy ID: NA.

MEMO

Date: **July 22, 2019**

To: **File**

From: **Rob Huening, Ramboll**

cc: **Daniel J Price, Ramboll**

Subject: **Calumet Montana Refining**
Data Usability Assessment
Methods 8260C, 8270, 6020A, MT EPH/VPH
SDG UF25046, 5 Soil Samples, 1 Water Sample

Data validation and usability assessment was conducted for data package UF25046 based on the National Functional Guidelines for Superfund Organic Methods Data Review OSWER 9355.0-132, EPA-540-R-014-002 (USEPA August 2014) and National Functional Guidelines for Superfund Inorganic Methods Data Review (USEPA August 2014). The following samples were reported in this data package:

Sample ID	Lab Sample ID
CMR-WB03-0.5-1.0-190622	UF25046-001
CMR-WB03-3.5-4.0-190622	UF25046-002
CMR-WB03-5.0-5.5-190622	UF25046-003
CMR-WB03-2.0-2.5-190622	UF25046-004
CMR-WB03-10.0-10.75-190622	UF25046-005
TB-25-20190622	UF25046-006

Data validation included a review of the following QC parameters:

- Data Package Completeness
- Preservation and Holding Times
- Instrument Performance Check
- Blanks
- Deuterated Monitoring Compound or Surrogate Spikes
- Matrix Spike/Matrix Spike Duplicate
- Field Duplicate Samples
- Laboratory Control Sample
- Internal Standards
- Tentatively Identified Compounds
- System Performance
- Overall Assessment of Data

QC criteria were met for each parameter with the following exceptions:

Surrogates/Internal Standards
Surrogates and/or internal standards were out of criteria for several samples analyzes. Surrogates out of criteria can indicate a possible accuracy bias. However, according to the lab narrative the recovery issues were likely due to sample dilutions or matrix effects. Therefore no results have been validated.

LCS/LCSD Recoveries
During analysis LCS/LCSD samples were run and recoveries were reported. These recoveries were largely in criteria with the exception of methyl acetate and bromomethane. The out of criteria recoveries indicate a possible bias. Low recoveries indicate a possible low bias and high recoveries indicate a possible high bias. In general, high bias does not affect non-detect results. Based on the potential bias all methyl acetate and bromomethane results have been validated as estimated.

Blank Detections
During analysis, acetone was detected in trip blank samples. This indicates a possible cross-contamination issue. Due to this, all low level detections should be evaluated for possible contamination bias. All acetone results below the RL or below 5x the blank result have been validated as non-detect (U).

Overall Assessment of Data
Overall, data are acceptable and usable for project objectives. The laboratory flags (*, F1) to denote out of criteria results were removed. Several results were flagged J by the laboratory because the concentrations calculated were below the method reporting limit and above the laboratory detection limit. The J flag was retained. These results should be considered estimated as the calculated concentrations are below the instrument calibration range.

No additional validation actions were taken on project samples. Results are usable for project purposes as validated.

Inorganic Data Review Summary

SDG No. UF25046

Site Calumet Montana Refining

Laboratory Shealy Environmental

Number of Samples/Matrix 5 Solid, 1 Water

Reviewer Name R Huening

Completion Date July 16, 2019

Review Criteria	Metals (Modified Skinner List)
Preservation and Holding Times	No issues
Blanks	No issues
Matrix Spike/Matrix Spike Duplicate	No MS/MSD results reported with samples, no action taken.
Laboratory Control Sample	No issues
Duplicate Samples	No issues
Other Non-conformances	No other non-conformances noted during analysis.
Overall Assessment of Data	No validation action warranted.

SDG No. UF25046

Site Calumet Montana Refining

Laboratory Shealy Environmental

Number of Samples/Matrix 5 Solid, 1 Water

Reviewer Name R Huening

Completion Date July 16, 2019

Review Criteria	VOC 8260C, SVOC 8270	VPH/EPH
Preservation and Holding Times	No issues	No issues
Blanks	Acetone detected in trip blank. All project sample detections of acetone validated as non-detect (U).	No issues
Deuterated Monitoring Compound or Surrogate Spikes	Surrogates out due to sample dilution, no action taken.	Surrogates out due to matrix interference/dilution, no action taken.
Matrix Spike/Matrix Spike Duplicate	No MS/MSD results reported with samples. No action taken.	No MS/MSD results reported with samples. No action taken.
Laboratory Control Sample	LCS out of high for acetone. See above. LCS out low for methyl acetate and bromomethane. All methyl acetate and bromomethane results validated as estimated (J, UJ).	No issues
Internal Standards	No issues	No issues
Tentatively Identified Compounds	No TICs identified by the lab.	N/A
Other Non-conformances	CCV out of criteria high for acetone. See above.	No other non-conformances noted.
Overall Assessment of Data	All methyl acetate and bromomethane results validated as estimated (J, UJ). All detected results for acetone validated as non-detect (U).	No validation action warranted.

Case Narrative
Ramboll US Corporation
Lot Number: UF25046

This Report of Analysis contains the analytical result(s) for the sample(s) listed on the Sample Summary following this Case Narrative. The sample receiving date is documented in the header information associated with each sample.

All results listed in this report relate only to the samples that are contained within this report.

Sample receipt, sample analysis, and data review have been performed in accordance with the most current approved NELAC standards, the Shealy Environmental Services, Inc. ("Shealy") Quality Assurance Management Plan (QAMP), standard operating procedures (SOPs), and Shealy policies. Any exceptions to the NELAC standards, the QAMP, SOPs or policies are qualified on the results page or discussed below.

Where applicable, all soil sample analysis are reported on a dry weight basis unless flagged with a "W" qualifier

If you have any questions regarding this report please contact the Shealy Project Manager listed on the cover page.

Volatiles
The laboratory control sample (LCS) associated with batch 21644 had acetone recovered above the acceptance limits. This could potentially result in a high bias on analytical results. There were no detections above the LOQ for this compound in the samples associated with this batch; therefore, data quality is not impacted.

The LCS associated with batch 21458 had methyl acetate recovered marginally outside of the acceptance limits. The LCS associated with batch 21574 had bromomethane recovered marginally outside of the acceptance limits. Due to the large number of analytes in the LCS, there is a high statistical probability of a few analytes outside of control limits. Per SW-846 Update V 8000D- 23 Revision 4 July 2014, a number of analytes should be allowed to marginally fail the limits without requirement for corrective action. The laboratory's SOP allows for 10% of analytes to recover marginally outside criteria.

The continuing calibration verification (CCV) associated with sample -006 had acetone recovered above the acceptance limits. This could potentially result in a high bias on analytical results. There were no detections above the LOQ for this compound in the associated samples; therefore, data quality is not impacted.

Sample -005 had the surrogate recovered outside of the acceptance limits due to sample dilution.

Semivolatiles
Sample -001 was diluted 100X due to high concentrations of target compounds. As a result, the associated surrogates were recovered outside of the acceptance limits. No corrective action was required, as dilutions of 5X and greater impact recovery accuracy.

Sampled -004 and -005 were diluted 25X due to the sample matrix. The reporting limits have been raised accordingly. The associated surrogates were recovered outside of the acceptance limits. No corrective action was required, as dilutions of 5X and greater impact recovery accuracy.

Montana EPH
Sample -005 had surrogates recovered outside of the acceptance limits due to objective evidence of matrix interference.

Montana VPH
Samples -001, and -005 had naphthalene detected in the VPH analysis and confirmed via dual detector analysis (FID/PID). However, additional compounds elute at approximately the same times as naphthalene and MTBE, making it difficult for analysts to distinguish the target compounds from non-target compounds. Second method confirmation was performed via GC/MS analysis. The results via dual detection (FID/PID) were not compared to or adjusted based on results via 8260B GC/MS. Samples -001, -004, and -005 had surrogates recovered outside of the acceptance limits due to objective evidence of matrix interference.

1,1,2-Trichloro-1,2,2-Trifluoroethane	76-13-1	8260B	ND		7.2	2.9	ug/kg	1

LOQ = Limit of Quantitation
B = Detected in the method blank
E = Quantitation of compound exceeded the calibration range
DL = Detection Limit
ND = Not detected at or above the DL
N = Recovery is out of criteria
P = The RPD between two GC columns exceeds 40%
J = Estimated result < LOQ and ≥ DL
H = Out of holding time
W = Reported on wet weight basis

LOQ = Limit of Quantitation
B = Detected in the method blank
E = Quantitation of compound exceeded the calibration range
DL = Detection Limit
ND = Not detected at or above the DL
N = Recovery is out of criteria
P = The RPD between two GC columns exceeds 40%
J = Estimated result < LOQ and ≥ DL
H = Out of holding time
W = Reported on wet weight basis

☑ Yes	☐ No		7. Were sample IDs listed on all sample containers?
☑ Yes	☐ No		8. Was collection date & time listed on the COC?
☑ Yes	☐ No		9. Was collection date & time listed on all sample containers?
☑ Yes	☐ No		10. Did all container label information (ID, date, time) agree with the COC?
☑ Yes	☐ No		11. Were tests to be performed listed on the COC?
☑ Yes	☐ No		12. Did all samples arrive in the proper containers for each test and/or in good condition (unbroken, lids on, etc.)?
☑ Yes	☐ No		13. Was adequate sample volume available?
☐ Yes	☑ No		14. Were all samples received within ½ the holding time or 48 hours, whichever comes first?
☐ Yes	☑ No		15. Were any samples containers missing/excess (circle one) samples Not listed on COC?
☐ Yes	☑ No	☐ NA	16. For VOA and RSK-175 samples, were bubbles present >"pea-size" (¼"or 6mm in diameter) in any of the VOA vials?
☐ Yes	☐ No	☑ NA	17. Were all DRO/metals/nutrient samples received at a pH of < 2?
☐ Yes	☐ No	☑ NA	18. Were all cyanide samples received at a pH > 12 and sulfide samples received at a pH > 9?
☐ Yes	☐ No	☑ NA	19. Were all applicable NH_3/TKN/cyanide/phenol/625 (< 0.5mg/L) samples free of residual chlorine?
☐ Yes	☐ No	☑ NA	20. Were client remarks/requests (i.e. requested dilutions, MS/MSD designations, etc…) correctly transcribed from the COC into the comment section in LIMS?
☐ Yes	☑ No		21. Was the quote number listed on the container label? If yes, Quote # NA

Sample Preservation (Must be completed for any sample(s) incorrectly preserved or with headspace.)

Sample(s) NA were received incorrectly preserved and were adjusted accordingly in sample receiving with NA mL of circle one: H2SO4, HNO3, HCl, NaOH using SR # NA.
Time of preservation NA. If more than one preservative is needed, please note in the comments below.

Sample(s) NA were received with bubbles >6 mm in diameter.

Samples(s) NA were received with TRC > 0.5 mg/L (If #19 is *no*) and were adjusted accordingly in sample receiving with sodium thiosulfate ($Na_2S_2O_3$) with Shealy ID: NA.

Subject: **Calumet Montana Refining**
Data Usability Assessment
Methods 8260C, 8270, 6020A, MT EPH/VPH
SDG UF26019, 3 Groundwater Samples, 1 Water Sample

Data validation and usability assessment was conducted for data package UF26019 based on the National Functional Guidelines for Superfund Organic Methods Data Review OSWER 9355.0-132, EPA-540-R-014-002 (USEPA August 2014) and National Functional Guidelines for Superfund Inorganic Methods Data Review (USEPA August 2014). The following samples were reported in this data package:

Sample ID	Lab Sample ID
CMR-MW79D-190625	UF26019-001
CMR-MW79S-190625	UF26019-002
CMR-MW99-190625	UF26019-003
TB-26-20190625	UF26019-004

Data validation included a review of the following QC parameters:

- Data Package Completeness
- Preservation and Holding Times
- Instrument Performance Check
- Blanks
- Deuterated Monitoring Compound or Surrogate Spikes
- Matrix Spike/Matrix Spike Duplicate
- Field Duplicate Samples
- Laboratory Control Sample
- Internal Standards
- Tentatively Identified Compounds
- System Performance
- Overall Assessment of Data

QC criteria were met for each parameter with the following exceptions:

Surrogates/Internal Standards
Surrogates and/or internal standards were out of criteria for several samples analyzes. Surrogates out of criteria can indicate a possible accuracy bias. However, according to the lab narrative the recovery issues were likely due to sample dilutions or matrix effects. Therefore no results have been validated.

LCS/LCSD Recoveries
During analysis LCS/LCSD samples were run and recoveries were reported. These recoveries were largely in criteria with the exception of phenol. The out of criteria recoveries indicate a possible bias. Low recoveries indicate a possible low bias and high recoveries indicate a possible high bias. In general, high bias does not affect non-detect results. Based on the potential bias all phenol results have been validated as estimated.

Blank Detections
During analysis, acetone was detected in trip blank samples. This indicates a possible cross-contamination issue. Due to this, all low level detections should be evaluated for possible contamination bias. All acetone results below the RL or below 5x the blank result have been validated as non-detect (U).

Overall Assessment of Data
Overall, data are acceptable and usable for project objectives. The laboratory flags (*, F1) to denote out of criteria results were removed. Several results were flagged J by the laboratory because the concentrations calculated were below the method reporting limit and above the laboratory detection limit. The J flag was retained. These results should be considered estimated as the calculated concentrations are below the instrument calibration range.

No additional validation actions were taken on project samples. Results are usable for project purposes as validated.

Attachment 1: Data Validation Summary Checklist

Inorganic Data Review Summary

SDG No. UF26019

Site Calumet Montana Refining

Laboratory Shealy Environmental

Number of Samples/Matrix 3 GW, 1 Water

Reviewer Name R Huening

Completion Date July 16, 2019

Review Criteria	Metals (Modified Skinner List)
Preservation and Holding Times	No issues
Blanks	No issues
Matrix Spike/Matrix Spike Duplicate	No MS/MSD results reported with samples, no action taken.
Laboratory Control Sample	No issues
Duplicate Samples	No issues
Other Non-conformances	No other non-conformances noted during analysis.
Overall Assessment of Data	No validation action warranted.

SDG No. UF26019

Site Calumet Montana Refining

Laboratory Shealy Environmental

Number of Samples/Matrix 3 GW, 1 Water

Reviewer Name R Huening

Completion Date July 16, 2019

Review Criteria	VOC 8260C, SVOC 8270	VPH/EPH
Preservation and Holding Times	No issues	No issues
Blanks	Acetone detected in trip blank. All project sample detections of acetone validated as non-detect (U).	No issues
Deuterated Monitoring Compound or Surrogate Spikes	Surrogates out due to sample dilution, no action taken.	No issues
Matrix Spike/Matrix Spike Duplicate	No MS/MSD results reported with samples. No action taken.	No MS/MSD results reported with samples. No action taken.
Laboratory Control Sample	LCS out of high for acetone. See above. LCS out low for phenol. All phenol results validated as estimated (J, UJ).	No issues
Internal Standards	No issues	No issues
Tentatively Identified Compounds	No TICs identified by the lab.	N/A
Other Non-conformances	CCV out of criteria high for acetone. See above.	No other non-conformances noted.
Overall Assessment of Data	All phenol results validated as estimated (J, UJ). All detected results for acetone validated as non-detect (U).	No validation action warranted.

Case Narrative
Ramboll US Corporation
Lot Number: UF26019

This Report of Analysis contains the analytical result(s) for the sample(s) listed on the Sample Summary following this Case Narrative. The sample receiving date is documented in the header information associated with each sample.

All results listed in this report relate only to the samples that are contained within this report.

Sample receipt, sample analysis, and data review have been performed in accordance with the most current approved NELAC standards, the Shealy Environmental Services, Inc. ("Shealy") Quality Assurance Management Plan (QAMP), standard operating procedures (SOPs), and Shealy policies. Any exceptions to the NELAC standards, the QAMP, SOPs or policies are qualified on the results page or discussed below.

If you have any questions regarding this report please contact the Shealy Project Manager listed on the cover page.

Volatiles
The laboratory control sample (LCS) associated with batch 21720 had acetone recovered above the acceptance limits. This could potentially result in a high bias on analytical results. There were no detections above the LOQ for this compound in the samples associated with this batch; therefore, data quality is not impacted.

Semivolatiles
The method blank associated with batch 21123 had bis(2-ethylhexyl)phthalate detected at a concentration that was below the LOQ. There were no detections for this compound in the samples associated with this method blank.

The LCS associated with batch 21123 had phenol recovered marginally outside of the acceptance limits. Due to the large number of analytes in the LCS, there is a high statistical probability of a few analytes outside of control limits. Per SW-846 Update V 8000D- 23 Revision 4 July 2014, a number of analytes should be allowed to marginally fail the limits without requirement for corrective action. The laboratory's SOP allows for 10% of analytes to recover marginally outside criteria.

Samples -001 and -003 were diluted 25X and 5X, respectively, due to the sample matrix. The reporting limits have been raised accordingly. The surrogates associated with sample -003 were recovered outside of the acceptance limits. No corrective action was required, as dilutions of 5X and greater impact recovery accuracy.

Sample -002 was diluted 250X due to high concentrations of a target compound. As a result, the associated surrogate was recovered outside of the acceptance limits. No corrective action was required, as dilutions of 5X and greater impact recovery accuracy.

Montana VPH
Sample -002 had naphthalene detected in the VPH analysis and confirmed via dual detector analysis (FID/PID). However, additional compounds elute at approximately the same times as naphthalene and MTBE, making it difficult for analysts to distinguish the target compounds from non-target compounds. Second method confirmation was performed via GC/MS analysis. The results via dual detection (FID/PID) were not compared to or adjusted based on results via 8260B GC/MS.

cc: **Daniel J Price, Ramboll**

Subject: **Calumet Montana Refining**
Data Usability Assessment
Methods 8260C, 8270, 6020A, MT EPH/VPH
SDG UF26025, 4 Soil Samples, 1 Water Sample

Data validation and usability assessment was conducted for data package UF26025 based on the National Functional Guidelines for Superfund Organic Methods Data Review OSWER 9355.0-132, EPA-540-R-014-002 (USEPA August 2014) and National Functional Guidelines for Superfund Inorganic Methods Data Review (USEPA August 2014). The following samples were reported in this data package:

Sample ID	Lab Sample ID
CMR-WB14-5.0-6.0-190625	UF26025-001
CMR-WB14-20.0-21.0-190625	UF26025-002
CMR-WB14-20.0-21.0-190625-DUP	UF26025-003
CMR-WB15-4.0-5.0-190625	UF26025-004
TB-27-20190625	UF26025-005

Data validation included a review of the following QC parameters:

- Data Package Completeness
- Preservation and Holding Times
- Instrument Performance Check
- Blanks
- Deuterated Monitoring Compound or Surrogate Spikes
- Matrix Spike/Matrix Spike Duplicate
- Field Duplicate Samples
- Laboratory Control Sample
- Internal Standards
- Tentatively Identified Compounds
- System Performance
- Overall Assessment of Data

QC criteria were met for each parameter with the following exceptions:

MS/MSD Recoveries
For the VOC and SVOC analysis suites MS/MSD results were reported. Recoveries were largely within criteria with the exception of beryllium and antimony. These out of criteria recoveries indicate a possible bias to results. Therefore, all beryllium and antimony results were flagged as estimated (J, UJ).

For the SVOC analysis suite MS/MSD results were reported to be almost universally out of criteria with extremely low recoveries. However, this is largely due to non-detected analytes. The MS/MSD sample was spike at a normal level but due to high native concentrations/ matrix issues, the sample was run at a high dilution. Therefore the spiked amount was at or below the reporting limit. Due to this, the low recoveries do not represent a systematic matrix issue. No validation action warranted.

Surrogates/Internal Standards
Surrogates and/or internal standards were out of criteria for several samples analyzes. Surrogates out of criteria can indicate a possible accuracy bias. However, according to the lab narrative the recovery issues were likely due to sample dilutions or matrix effects. Therefore no results have been validated.

LCS/LCSD Recoveries
During analysis LCS/LCSD samples were run and recoveries were reported. These recoveries were largely in criteria with the exception of acetone and bromomethane. The out of criteria recoveries indicate a possible bias. Low recoveries indicate a possible low bias and high recoveries indicate a possible high bias. In general, high bias does not affect non-detect results. Based on the potential bias all acetone and bromomethane results have been validated as estimated.

Overall Assessment of Data
Overall, data are acceptable and usable for project objectives. The laboratory flags (*, F1) to denote out of criteria results were removed. Several results were flagged J by the laboratory because the concentrations calculated were below the method reporting limit and above the laboratory detection limit. The J flag was retained. These results should be considered estimated as the calculated concentrations are below the instrument calibration range.

No additional validation actions were taken on project samples. Results are usable for project purposes as validated.

Attachment 1: Data Validation Summary Checklist

Inorganic Data Review Summary

SDG No. UF26025

Site Calumet Montana Refining

Laboratory Shealy Environmental

Number of Samples/Matrix 4 Soil, 1 Water

Reviewer Name R Huening

Completion Date July 16, 2019

Review Criteria	Metals (Modified Skinner List)
Preservation and Holding Times	No issues
Blanks	No issues
Matrix Spike/Matrix Spike Duplicate	MS/MSD recoveries out for multiple metals likely due to high native sample concentrations. Beryllium and antimony recoveries out with acceptable spikes. All beryllium and antimony results validated as estimated (J, UJ).
Laboratory Control Sample	No issues
Duplicate Samples	One FD submitted with samples. Acceptable agreement, no action taken.
Other Non-conformances	No other non-conformances noted during analysis.
Overall Assessment of Data	All beryllium and antimony results validated as estimated (J, UJ).

SDG No. UF26025

Site Calumet Montana Refining

Laboratory Shealy Environmental

Number of Samples/Matrix 4 Soil, 1 Water

Reviewer Name R Huening

Completion Date July 16, 2019

Review Criteria	VOC 8260C, SVOC 8270	VPH/EPH
Preservation and Holding Times	No issues	No issues
Blanks	No issues	No issues
Deuterated Monitoring Compound or Surrogate Spikes	Surrogates out due to sample dilution, no action taken.	No issues
Matrix Spike/Matrix Spike Duplicate	VOC MS/MSD recoveries out of criteria high for multiple analytes with no detections. Low recoveries for some non-COC analytes. No action taken. SVOC MS/MSD out of criteria for vast majority of analytes, likely due to dilution. No action taken.	MS/MSD recoveries out of criteria likely due to high native sample concentrations, no action taken.
Laboratory Control Sample	LCS out of high for acetone. Acetone detected results validated as estimated (J). LCS out high for MEK with no detections, no action taken. LCS out low for bromomethane. All bromomethane results validated as estimated (J, UJ).	No issues
Field Duplicates	One FD submitted with samples. Results show acceptable agreement, no action taken.	One FD submitted with samples. Results show acceptable agreement, no action taken.
Internal Standards	No issues	No issues
Tentatively Identified Compounds	No TICs identified by the lab.	N/A
Other Non-conformances	CCV out of criteria high for acetone. See above.	No other non-conformances noted.

SDG No. UF26025

Site Calumet Montana Refining

Laboratory Shealy Environmental

Number of Samples/Matrix 4 Soil, 1 Water

Reviewer Name R Huening

Completion Date July 16, 2019

Review Criteria	VOC 8260C, SVOC 8270	VPH/EPH
Overall Assessment of Data	All bromomethane results validated as estimated (J, UJ). Acetone detected results validated as estimated (J).	No validation action warranted.

SHEALY ENVIRONMENTAL SERVICES, INC.

Report of Analysis

Ramboll US Corporation
333 West Wacker Drive
Suite 2700
Chicago, IL 60606
Attention: Michael Wilson

Project Name: CMR RIAIM - West Rail

Project Number: 1690012344-003

Lot Number:**UF26025**

Date Completed:07/11/2019

07/12/2019 12:53 PM
Approved and released by:
Project Manager: Kelly M. Nance

Case Narrative
Ramboll US Corporation
Lot Number: UF26025

This Report of Analysis contains the analytical result(s) for the sample(s) listed on the Sample Summary following this Case Narrative. The sample receiving date is documented in the header information associated with each sample.

All results listed in this report relate only to the samples that are contained within this report.

Sample receipt, sample analysis, and data review have been performed in accordance with the most current approved NELAC standards, the Shealy Environmental Services, Inc. ("Shealy") Quality Assurance Management Plan (QAMP), standard operating procedures (SOPs), and Shealy policies. Any exceptions to the NELAC standards, the QAMP, SOPs or policies are qualified on the results page or discussed below.

Where applicable, all soil sample analysis are reported on a dry weight basis unless flagged with a "W" qualifier

If you have any questions regarding this report please contact the Shealy Project Manager listed on the cover page.

Volatiles
The laboratory control sample (LCS) associated with batch 21574 had bromomethane recovered marginally outside of the acceptance limits. Due to the large number of analytes in the LCS, there is a high statistical probability of a few analytes outside of control limits. Per SW-846 Update V 8000D- 23 Revision 4 July 2014, a number of analytes should be allowed to marginally fail the limits without requirement for corrective action. The laboratory's SOP allows for 10% of analytes to recover marginally outside criteria.

The LCS associated with batch 21776 had acetone and 2-butanone (MEK) recovered above the acceptance limits. This could potentially result in a high bias on analytical results. There were no detections for these compounds in the samples associated with this batch; therefore, data quality is not impacted.

The matrix spike/matrix spike duplicate (MS/MSD) associated with sample -004 had multiple compounds recovered outside of the acceptance limits. Additionally, a number of RPDs exceeded the acceptance limit. The MS associated with sample -003 had multiple compounds recovered outside of the acceptance limits The LCS were recovered within the required acceptance limits; therefore, this likely demonstrates a matrix effect.

The /continuing calibration verification (CCV) associated with sample -005 had acetone recovered above the acceptance limits. This could potentially result in a high bias on analytical results. There were no detections for this compound in the associated samples; therefore, data quality is not impacted.

Sample -004 was analyzed high level due to the sample matrix. The reporting limits have been raised accordingly.

Semivolatiles
The MS/MSD associated with sample -004 had multiple compounds and surrogates recovered outside of the acceptance limits. Additionally, a number of RPDs exceeded the acceptance limit. No corrective

action was required, as dilutions greater than 5X reduce the concentration of the MS spikes to a level that impacts recovery accuracy. The sample results are reported and no corrective action is required.

Sample -004 was diluted 100X due to the sample matrix. The reporting limits have been raised accordingly. The associated surrogates were recovered outside of the acceptance limits. No corrective action was required, as dilutions of 5X and greater impact recovery accuracy.

Montana EPH
The MS/MSD associated with sample -004 had C19-C36 Aliphatics and C9-C18 Aliphatics recovered outside of the acceptance limits. The LCS was recovered within the required acceptance limits; therefore, this likely demonstrates a matrix effect.

The MSD associated with sample -004 had surrogates recovered outside of the acceptance limits. The sample, MS, and LCS had all surrogates recovered within the acceptance limits; therefore, the sample results are reported.

Montana VPH
Sample -004 had naphthalene detected in the VPH analysis and confirmed via dual detector analysis (FID/PID). However, additional compounds elute at approximately the same times as naphthalene and MTBE, making it difficult for analysts to distinguish the target compounds from non-target compounds. Second method confirmation was performed via GC/MS analysis. The results via dual detection (FID/PID) were not compared to or adjusted based on results via 8260B GC/MS.

The MS/MSD associated with sample -004 had multiple compounds and surrogates recovered outside of the acceptance limits. Additionally, a number of RPDs exceeded the acceptance limit.The LCS were recovered within the required acceptance limits; therefore, this likely demonstrates a matrix effect.

The RPD for acetone in the duplicate associated with sample -002 exceeded the acceptance limit. The associated sample results were reported.

Sample -004 had surrogates recovered outside of the acceptance limits due to confirmed matrix interference.

Metals
The MS/MSD associated with sample -004 had multiple metals recovered outside of the acceptance limits. Additionally, a number of RPDs exceeded the acceptance limit.The LCS was recovered within the required acceptance limits; therefore, this likely demonstrates a matrix effect.

LOQ = Limit of Quantitation
B = Detected in the method blank
E = Quantitation of compound exceeded the calibration range
DL = Detection Limit
ND = Not detected at or above the DL
N = Recovery is out of criteria
P = The RPD between two GC columns exceeds 40%
J = Estimated result < LOQ and ≥ DL
H = Out of holding time
W = Reported on wet weight basis

Volatile Organic Compounds by GC/MS

Client: Ramboll US Corporation
Laboratory ID: UF26025-005
Description: TB-27-20190625
Matrix: Aqueous
Date Sampled: 06/25/2019
Date Received: 06/26/2019

Run	Prep Method	Analytical Method	Dilution	Analysis Date	Analyst	Prep Date	Batch
1	5030B	8260B	1	07/07/2019 1458	ECB		21776

Parameter	CAS Number	Analytical Method	Result	Q	LOQ	DL	Units	Run
1,2,3-Trichlorobenzene	87-61-6	8260B	ND		0.50	0.40	ug/L	1
1,2,4-Trichlorobenzene	120-82-1	8260B	ND		0.50	0.40	ug/L	1
1,1,1-Trichloroethane	71-55-6	8260B	ND		0.50	0.40	ug/L	1
1,1,2-Trichloroethane	79-00-5	8260B	ND		0.50	0.40	ug/L	1
Trichloroethene	79-01-6	8260B	ND		0.50	0.40	ug/L	1
Trichlorofluoromethane	75-69-4	8260B	ND		0.50	0.40	ug/L	1
Vinyl chloride	75-01-4	8260B	ND		0.50	0.40	ug/L	1
Xylenes (total)	1330-20-7	8260B	ND		1.0	0.40	ug/L	1
m+p - Xylenes	179601-23-1	8260B	ND		0.50	0.40	ug/L	1
o - Xylenes	95-47-6	8260B	ND		0.50	0.40	ug/L	1

Surrogate	Q	Run 1 % Recovery	Acceptance Limits
1,2-Dichloroethane-d4		91	70-130
Bromofluorobenzene		101	70-130
Toluene-d8		100	70-130

LOQ = Limit of Quantitation
ND = Not detected at or above the DL
H = Out of holding time
B = Detected in the method blank
N = Recovery is out of criteria
W = Reported on wet weight basis
E = Quantitation of compound exceeded the calibration range
P = The RPD between two GC columns exceeds 40%
DL = Detection Limit
J = Estimated result < LOQ and ≥ DL
